Subject: Importation of Apotex Inc.'s Canadian approved Apo-Varenicline (varenicline tartrate) 0.5 mg and 1 mg (based on free base equivalents) Tablets to Address Drug Shortage

Dear Healthcare Professional:

In order to alleviate a critical shortage of CHANTIX® (varenicline tartrate) tablets 0.5 mg and 1 mg in the United States (U.S.) market for the indicated use as an aid to smoking cessation, Apotex Corp. is coordinating with the U.S. Food and Drug Administration (FDA) to temporarily import into the U.S. the non-FDA approved drug, Apo-Varenicline (varenicline tartrate) 0.5 mg and 1 mg (free base equivalent) tablets to increase the availability of the drug. The varenicline tartrate tablets marketed in Canada under the name Apo-Varenicline by Apotex Inc. are approved by Health Canada as a generic equivalent to CHAMPIX®¹ tablets manufactured by Pfizer Canada, Inc., and are manufactured in an FDA-inspected facility that complies with current Good Manufacturing Practice (cGMP) requirements.

At this time, no other entity except Apotex Corp. is authorized by the FDA to import or distribute Apotex Inc.'s Apo-Varenicline (varenicline tartrate) 0.5 mg and 1 mg (free base equivalent) tablets in the U.S. However, this does not represent a formal FDA approval of Apotex Inc.'s Apo-Varenicline (varenicline tartrate) tablets in the United States.

Effective immediately, Apotex Corp. will distribute the following presentations of Apotex Inc.'s Apo-Varenicline (varenicline tartrate) tablets to address the critical shortage:

Table 1

Product Name	Quantity	Tablet Description	U.S. NDC
Apo-Varenicline (varenicline tartrate) tablet, 0.5 mg (free base equivalent)	Bottle of 56 tablets	White colored, modified capsule-shaped, biconvex, film coated tablets, engraved with "APO" on one side and "VAR" over "0.5" on the other side.	60505-4765-5 

¹ CHAMPIX® is the brand name of CHANTIX® sold in Canada

Product Name	Quantity	Tablet Description	U.S. NDC
Apo-Varenicline (varenicline tartrate) tablet, 1 mg (free base equivalent)	Bottle of 56 tablets	Blue colored, modified capsule-shaped, biconvex, film coated tablets, engraved with "APO" on one side and "VAR" over "1" on the other side.	60505-4766-6 
Apo-Varenicline (varenicline tartrate) tablet, 0.5 mg and 1 mg (free base equivalent)	Starter Blister Pack of 53 tablets	0.5 mg: White colored, modified capsule-shaped, biconvex, film coated tablets, engraved with "APO" on one side and "VAR" over "0.5" on the other side. 1 mg: Blue colored, modified capsule-shaped, biconvex, film coated tablets, engraved with "APO" on one side and "VAR" over "1" on the other side.	60505-4767-0 
Apo-Varenicline (varenicline tartrate) tablet, 1 mg (free base equivalent)	Continuation Blister Pack of 56 tablets	Blue colored, modified capsule-shaped, biconvex, film coated tablets, engraved with "APO" on one side and "VAR" over "1" on the other side.	60505-4766-5 

The product container label will display the text that is approved for marketing the products in Canada with both official languages, English and French. It is important to note that there are differences in the format and content of the labeling between Apo-Varenicline (varenicline tartrate), whether 0.5 mg or 1 mg varenicline free base equivalent, and CHANTIX® (varenicline tartrate) tablets. Please see the product comparison tables at the end of this letter.

CHANTIX® (varenicline tartrate) tablets are available only by prescription in the U.S. Please refer to the package insert for CHANTIX® (varenicline tartrate) tablets for full prescribing information. Ensure that your staff and others in your office and/or pharmacy who may be involved in the prescribing and/or dispensing of Apo-Varenicline (varenicline tartrate) receive a copy of this letter, review the information and instruct patients on the differences between CHANTIX® (varenicline tartrate) and Apo-Varenicline (varenicline tartrate).

The barcode on the imported product label may not register accurately on the U.S. scanning systems. Institutions should manually input the imported product information into their systems and confirm that the barcode, if scanned, provides correct information. Alternative procedures should be followed to assure that the correct drug product is being used and administered to individual patients. Barcodes for the U.S. NDCs for product identification are provided in Table 1 and Appendix 1 to assist with input into institutional systems.

In addition, Apotex Inc.'s Apo-Varenicline (varenicline tartrate) does not meet the product identifier requirements of the Drug Supply Chain Security Act (DSCSA) for the Interoperable Exchange of

Information for Tracing of Human, Finished Prescription Drugs. Apo-Varenicline (varenicline tartrate) blister packs are not child resistant.

If you have any questions about the information contained in this letter, any quality related problems, or questions on the use of Apotex Inc.'s Apo-Varenicline (varenicline tartrate), please contact Apotex Corp. Customer Service at 1-800-706-5575.

For ordering information, please contact your primary wholesaler or distributor to place an order with Apotex Corp. at 1-800-706-5575.

Healthcare providers should report adverse events associated with the use of Apotex Inc.'s Apo-Varenicline (varenicline tartrate) to Apotex Corp. at 1-800-706-5575.

Adverse events or quality problems experienced with the use of this product may also be reported to the FDA's MedWatch Adverse Event Reporting Program either online, by regular mail, or by fax:

- Complete and submit the report Online: www.fda.gov/medwatch/report.htm
- Regular mail or Fax: Download form www.fda.gov/MedWatch/getforms.htm or call 1-800-332-1088 to request a reporting form, then complete and return to the address on the preaddressed form or submit by fax to 1-800-FDA-0178.

We remain at your disposal to answer any questions you may have about our product and to provide more information if needed.

Sincerely,

Kiran Krishnan, PhD
Senior Vice President, Global Regulatory and Medical Affairs
Apotex Corp.

Side-by-Side Comparison Table

Appendix 3: Prescribing Information Side-by-Side Comparison Table

	U.S. FDA Approved Product	Import Product						
Product Name	CHANTIX® (varenicline) tablets	APO-VARENICLINE (Varenicline Tablets)						
Indication	<p>1 INDICATIONS AND USAGE</p> <p>CHANTIX is indicated for use as an aid to smoking cessation treatment.</p>	<p>INDICATIONS AND CLINICAL USE</p> <p>Adults APO-VARENICLINE (varenicline tartrate) is indicated for smoking-cessation treatment in adults, in conjunction with smoking-cessation counselling.</p> <p>Geriatrics (> 65 years of age): No dosage adjustment is necessary for healthy elderly patients. However, varenicline is known to be substantially excreted by the kidney, and the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function (see WARNINGS AND PRECAUTIONS, Special Populations: Geriatrics).</p> <p>Pediatrics (< 18 years of age): Based on the data submitted and reviewed by Health Canada, the safety and efficacy of varenicline in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use (see WARNINGS AND PRECAUTIONS, Special Populations: Pediatrics).</p>						
Dosage and Administration	<p>2 DOSAGE AND ADMINISTRATION</p> <p>2.1 Usual Dosage for Adults</p> <p>Smoking cessation therapies are more likely to succeed for patients who are motivated to stop smoking and who are provided additional advice and support. Provide patients with appropriate educational materials and counseling to support the quit attempt.</p> <p>The patient should set a date to stop smoking. Begin CHANTIX dosing one week before this date. Alternatively, the patient can begin CHANTIX dosing and then quit smoking between days 8 and 35 of treatment.</p> <p>CHANTIX should be taken orally after eating and with a full glass of water.</p> <p>The recommended dose of CHANTIX is 1 mg twice daily following a 1-week titration as follows:</p> <table border="1"> <tbody> <tr> <td>Days 1 – 3:</td> <td>0.5 mg once daily</td> </tr> <tr> <td>Days 4 – 7:</td> <td>0.5 mg twice daily</td> </tr> <tr> <td>Day 8 – end of treatment:</td> <td>1 mg twice daily</td> </tr> </tbody> </table> <p>Patients should be treated with CHANTIX for 12 weeks. For patients who have successfully stopped smoking at the end of 12 weeks, an additional course of 12 weeks treatment with CHANTIX is recommended to further increase the likelihood of long-term abstinence.</p> <p>For patients who are sure that they are not able or willing to quit abruptly, consider a gradual approach to quitting smoking with CHANTIX. Patients should begin CHANTIX dosing and reduce smoking by 50% from baseline within the first four weeks.</p>	Days 1 – 3:	0.5 mg once daily	Days 4 – 7:	0.5 mg twice daily	Day 8 – end of treatment:	1 mg twice daily	<p><u>DOSAGE AND ADMINISTRATION</u></p> <p><u>Dosing Considerations</u></p> <p>Smoking-cessation therapies are more likely to succeed for patients who are motivated to stop smoking and who are provided additional counselling and /or support services. In the clinical trials on which approval was based, varenicline was used with supportive counselling. Physicians should review the patient’s overall smoking-cessation plan that includes treatment with APO-VARENICLINE.</p> <p>The majority of clinical evidence in efficacy and safety was based on a 1 mg BID dose (see CLINICAL TRIALS). There is little clinical experience with doses above the maximum recommended dose of 1 mg BID.</p> <p>There is limited data available for dose comparison. In the one randomized clinical trial that included both 1 mg BID and 0.5 mg BID arms and that was designed to compare each of the two doses to placebo, and not to each other, the quit rates for 1 mg BID (n=253), 0.5 mg BID (n=253) and placebo (n=121) were:</p> <ul style="list-style-type: none"> • for Weeks 9 to 12: 51%, 45%, and 12% respectively, and • for Weeks 9 to 52: 23%, 19% and 4% respectively. <p>For further information on this study, see CLINICAL TRIAL, study 1.</p> <p>Based on the limited data available, it cannot be concluded that there is a difference between the two doses in the rate of serious neuropsychiatric events (see ADVERSE REACTIONS, Neuropsychiatric Adverse Events in Randomized Double Blind, Placebo Controlled Clinical Studies of Varenicline).</p> <p>APO-VARENICLINE should be taken after eating and with a full glass of water.</p> <p>Patients with Severe Renal Impairment</p> <p>The maximum recommended dose for this population is 0.5 mg twice daily (see below: Special Populations, Patients with Impaired Renal Function).</p> <p><u>Recommended Dose and Dosage Adjustment</u></p> <p>Adults</p>
Days 1 – 3:	0.5 mg once daily							
Days 4 – 7:	0.5 mg twice daily							
Day 8 – end of treatment:	1 mg twice daily							

Side-by-Side Comparison Table

	<p>by an additional 50% in the next four weeks, and continue reducing with the goal of reaching complete abstinence by 12 weeks. Continue CHANTIX treatment for an additional 12 weeks, for a total of 24 weeks of treatment. Encourage patients to attempt quitting sooner if they feel ready [see <i>Clinical Studies (14.5)</i>].</p> <p>Patients who are motivated to quit, and who did not succeed in stopping smoking during prior CHANTIX therapy for reasons other than intolerability due to adverse events or who relapsed after treatment, should be encouraged to make another attempt with CHANTIX once factors contributing to the failed attempt have been identified and addressed.</p> <p>Consider a temporary or permanent dose reduction in patients who cannot tolerate the adverse effects of CHANTIX.</p>	<p>Setting a quit date: There are three ways to set a quit date with APO-VARENICLINE:</p> <ul style="list-style-type: none"> • Fixed quit approach: The patient sets a date to stop smoking. APO-VARENICLINE dosing should start 1 to 2 weeks before this date (see CLINICAL TRIALS). <p>or</p> <ul style="list-style-type: none"> • Flexible quit approach: The patient begins APO-VARENICLINE and then quits smoking between days 8 and 35 of treatment (i.e. between Weeks 2 and 5) (see ACTION AND CLINICAL PHARMACOLOGY, Special Populations, Flexibility in Setting a Quit Date). <p>or</p> <ul style="list-style-type: none"> • Gradual quit approach: The patient starts taking APO-VARENICLINE with a goal to quit smoking by end of 12 weeks of treatment. The patient should gradually reduce smoking during the first 12 weeks of treatment such as 50% reduction or more by 4 weeks of treatment, 75% or more by 8 weeks to reach 100% by 12 weeks (see ACTION AND CLINICAL PHARMACOLOGY, Special Populations). <p>Dosing Options Following one week of titration, there is a choice of two doses for APO-VARENICLINE: 0.5 mg BID or 1 mg BID. As shown in the table below, the two titration schedules are identical from Day 1 to Day 7, separating at Day 8 when the patient either remains on 0.5 mg BID or moves up to 1 mg BID.</p> <table border="1" data-bbox="1163 787 1843 950"> <thead> <tr> <th>Day</th> <th colspan="2">Dosing Regimen 0.5 mg BID</th> </tr> </thead> <tbody> <tr> <td>Days 1 to 3:</td> <td>0.5 mg once daily</td> <td>0.5 mg once daily</td> </tr> <tr> <td>Days 4 to 7:</td> <td>0.5 mg twice daily</td> <td>0.5 mg twice daily</td> </tr> <tr> <td>Day 8 – onward</td> <td>0.5 mg twice daily</td> <td>1 mg twice daily</td> </tr> </tbody> </table> <p>The choice of dosing regimen should be based on physician judgment and patient preference, following discussion with the patient (see also Dosing Considerations). Once APO-VARENICLINE treatment is initiated, the dose may be changed, temporarily or permanently, according to patient and physician judgments on tolerability and efficacy.</p> <p>Patients who follow one of the first 2 approaches to setting a quit date (1 to 2 weeks after starting the treatment or between days 8 and 35 of treatment) should be treated with APO-VARENICLINE for 12 weeks. For patients who have successfully stopped smoking at the end of 12 weeks, an additional course of 12 weeks treatment with APO-VARENICLINE may be considered. No data are available on the efficacy of an additional 12 week course of treatment with varenicline for patients who have not successfully stopped smoking at the end of 12 weeks.</p> <p>Patients who follow the gradual quit approach (Week 12) should be treated with APO-VARENICLINE for 24 weeks.</p> <p>Dose tapering may be considered. Regardless of whether the treatment course is 12 or 24 weeks, risk of smoking-cessation relapse is elevated in the period immediately following the end of drug treatment (see CLINICAL TRIALS). In addition, dose tapering may help minimize discontinuation symptoms (e.g., increase in irritability, urge to</p>	Day	Dosing Regimen 0.5 mg BID		Days 1 to 3:	0.5 mg once daily	0.5 mg once daily	Days 4 to 7:	0.5 mg twice daily	0.5 mg twice daily	Day 8 – onward	0.5 mg twice daily	1 mg twice daily
Day	Dosing Regimen 0.5 mg BID													
Days 1 to 3:	0.5 mg once daily	0.5 mg once daily												
Days 4 to 7:	0.5 mg twice daily	0.5 mg twice daily												
Day 8 – onward	0.5 mg twice daily	1 mg twice daily												

Side-by-Side Comparison Table

<p>2.2 Dosage in Special Populations</p> <p><u>Patients with Impaired Renal Function</u></p> <p>No dosage adjustment is necessary for patients with mild to moderate renal impairment. For patients with severe renal impairment (estimated creatinine clearance less than 30 mL per min), the recommended starting dose of CHANTIX is 0.5 mg once daily. The dose may then be titrated as needed to a maximum dose of 0.5 mg twice daily. For patients with end-stage renal disease undergoing hemodialysis, a maximum dose of 0.5 mg once daily may be administered if tolerated [see <i>Use in Specific Populations</i> (8.6), <i>Clinical Pharmacology</i> (12.3)].</p> <p><u>Elderly and Patients with Impaired Hepatic Function</u></p> <p>No dosage adjustment is necessary for patients with hepatic impairment. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function [see <i>Use in Specific Populations</i> (8.5)].</p>	<p>smoke, depression, and/or insomnia), observed in up to 3% of patients at the end of treatment.</p> <p>Special Populations</p> <p><i>Psychiatric Patients</i></p> <p>Patients with a history of psychiatric symptoms who are attempting to quit smoking should be monitored by their healthcare professional for new or worsened psychiatric events. Those with a current condition should be clinically stable. Patients should be instructed that if they develop worsened or new symptoms, to report these to their healthcare provider, so that dose adjustments of psychiatric medications and/or APO-VARENICLINE may be considered (see also WARNINGS AND PRECAUTIONS, Special Populations, Psychiatric Patients).</p> <p><i>Patients with Impaired Renal Function:</i></p> <p>No dosage adjustment is necessary for patients with mild (estimated creatinine clearance > 50 mL/min and</p>

		<p>Continuation dosing pack: 1 mg tablets in blister strips of 56 tablets</p> <p>Nonmedicinal ingredients are anhydrous dibasic calcium phosphate, magnesium stearate, and microcrystalline cellulose. The film-coating contains hydroxypropyl cellulose, hydroxypropyl methylcellulose, titanium dioxide and triacetin. The 1 mg tablet also contains indigotine aluminum lake 12-14% as a colouring agent.</p>
Contraindications	<p>4 CONTRAINDICATIONS</p> <p>CHANTIX is contraindicated in patients with a known history of serious hypersensitivity reactions or skin reactions to CHANTIX.</p>	<p>CONTRAINDICATIONS</p> <p>Patients who are hypersensitive to varenicline or to any ingredient in the formulation or component of the container.</p>
Warnings and Precautions	<p>5 WARNINGS AND PRECAUTIONS</p> <p>5.1 Neuropsychiatric Adverse Events including Suicidality</p> <p>Serious neuropsychiatric adverse events have been reported in patients being treated with CHANTIX [see <i>Adverse Reactions (6.2)</i>]. These postmarketing reports have included changes in mood (including depression and mania), psychosis, hallucinations, paranoia, delusions, homicidal ideation, aggression, hostility, agitation, anxiety, and panic, as well as suicidal ideation, suicide attempt, and completed suicide. Some patients who stopped smoking may have been experiencing symptoms of nicotine withdrawal, including depressed mood. Depression, rarely including suicidal ideation, has been reported in smokers undergoing a smoking cessation attempt without medication. However, some of these adverse events occurred in patients taking CHANTIX who continued to smoke.</p> <p>Neuropsychiatric adverse events occurred in patients without and with pre-existing psychiatric disease; some patients experienced worsening of their psychiatric illnesses. Some neuropsychiatric adverse events, including unusual and sometimes aggressive behavior directed to oneself or others, may have been worsened by concomitant use of alcohol [see <i>Warnings and Precautions (5.3), Adverse Reactions (6.2)</i>]. Observe patients for the occurrence of neuropsychiatric adverse events. Advise patients and caregivers that the patient should stop taking CHANTIX and contact a healthcare provider immediately if agitation, depressed mood, or changes in behavior or thinking that are not typical for the patient are observed, or if the patient develops suicidal ideation or suicidal behavior. The healthcare provider should evaluate the severity of the symptoms and the extent to which the patient is benefiting from treatment, and consider options including dose reduction, continued treatment under closer monitoring, or discontinuing treatment. In many postmarketing cases, resolution of symptoms after discontinuation of CHANTIX was reported. However, the symptoms persisted in some cases; therefore, ongoing monitoring and supportive care should be provided until symptoms resolve.</p> <p>The neuropsychiatric safety of CHANTIX was evaluated in a randomized, double-blind, active and placebo-controlled study that included patients without a history of psychiatric disorder (non-psychiatric cohort, N=3912) and patients with a history of psychiatric disorder (psychiatric cohort, N=4003). In the non-psychiatric cohort, CHANTIX was not associated with an increased incidence of clinically significant neuropsychiatric adverse events in a composite endpoint comprising anxiety, depression, feeling abnormal, hostility, agitation, aggression, delusions, hallucinations, homicidal ideation, mania, panic, and irritability. In the psychiatric cohort, there were more events reported in each treatment group compared to the non-psychiatric cohort, and the incidence of events in the composite endpoint was higher for each of the</p>	<p>WARNINGS AND PRECAUTIONS</p> <p><u>Psychiatric Symptoms (in Patients with and without Pre-existing Psychiatric Disorder or Symptoms)</u> (see also ADVERSE REACTIONS, Post-Marketing Experience)</p> <p>There have been post-marketing reports of serious neuropsychiatric symptoms in patients being treated with varenicline, including anxiety, psychosis, mood swings, depressed mood, agitation, aggression, hostility, changes in behavior or thinking, suicidal ideation, suicidal behavior and suicide, as well as worsening of pre-existing psychiatric disorder (previously diagnosed or not). Not all patients had stopped smoking at the time of onset of symptoms, and not all patients had known pre-existing psychiatric illness, or were using concomitant CNS drugs.</p> <p>Randomized Study Data: A large randomized, double-blind, active and placebo-controlled study (“EAGLES” study) was conducted to compare the risk of serious neuropsychiatric events in patients with and without a history of psychiatric disorder treated for smoking cessation with varenicline, bupropion, nicotine replacement therapy patch (NRT) or placebo. The primary safety endpoint was a composite of neuropsychiatric adverse events that have been reported in post-marketing experience. The findings were that the use of varenicline, in patients with or without a history of psychiatric disorder, was not associated with an increased risk of serious neuropsychiatric adverse events in the composite primary endpoint compared with placebo (See ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions, Neuropsychiatric Safety Study in Subjects with and without a History of Psychiatric Disorder).</p> <p>Recommendations: Clinicians should be aware of the possible emergence of serious neuropsychiatric symptoms in patients attempting to quit smoking, with or without treatment.</p> <p>Alcohol Intake: There have been post-marketing reports of patients experiencing increased intoxicating effects of alcohol while taking varenicline. Some cases described unusual and sometimes aggressive behaviour, and were often accompanied by amnesia for the events.</p> <p>Pre-existing Psychiatric Disorder or Symptoms: Smoking cessation, with or without pharmacotherapy, has been associated with exacerbation of underlying psychiatric illness (e.g. depression, anxiety). Patients with a history of psychiatric symptoms should be monitored for worsening or new symptoms when attempting to quit smoking, regardless of how well controlled symptoms may be when starting smoking cessation treatment. Patients should be instructed to report strongly atypical and concerning symptoms to their healthcare provider, so that dose adjustments of psychiatric medications or APO-VARENICLINE may be considered.</p> <p>General: Patients should be informed that if they experience thoughts, moods or behaviours that are strongly atypical and concerning while on smoking-cessation</p>

Side-by-Side Comparison Table

	<p>active treatments compared to placebo: Risk Differences (RDs) (95%CI) vs. placebo were 2.7% (-0.05, 5.4) for CHANTIX, 2.2% (-0.5, 4.9) for bupropion, and 0.4% (-2.2, 3.0) for transdermal nicotine. In the non-psychiatric cohort, neuropsychiatric adverse events of a serious nature were reported in 0.1% of CHANTIX-treated patients and 0.4% of placebo-treated patients. In the psychiatric cohort, neuropsychiatric events of a serious nature were reported in 0.6% of CHANTIX-treated patients, with 0.5% involving psychiatric hospitalization. In placebo-treated patients, serious neuropsychiatric events occurred in 0.6%, with 0.2% requiring psychiatric hospitalization [see <i>Clinical Studies (14.10)</i>].</p>	<p>medication, including APO-VARENICLINE, the medication should be discontinued immediately, with urgent medical help sought as needed, and the symptoms reported to their healthcare provider.</p>
<p>5.2 Seizures</p>	<p>During clinical trials and the postmarketing experience, there have been reports of seizures in patients treated with CHANTIX. Some patients had no history of seizures, whereas others had a history of seizure disorder that was remote or well-controlled. In most cases, the seizure occurred within the first month of therapy. Weigh this potential risk against the potential benefits before prescribing CHANTIX in patients with a history of seizures or other factors that can lower the seizure threshold. Advise patients to discontinue CHANTIX and contact a healthcare provider immediately if they experience a seizure while on treatment [see <i>Adverse Reactions (6.2)</i>].</p>	<p><u>Seizures</u> In clinical trials and post-marketing experience there have been reports of seizures in patients treated with varenicline. Some patients had no history of seizures, whereas others had a history of seizure disorder that was remote or well-controlled. APO-VARENICLINE should be used cautiously in patients with a history of seizures or other conditions that potentially lower the seizure threshold. Advise patients to discontinue APO-VARENICLINE and immediately contact a healthcare provider if they experience a seizure while on treatment (see Special Populations, Use of APO-VARENICLINE in Patients with Concomitant Conditions).</p>
<p>5.3 Interaction with Alcohol</p>	<p>There have been postmarketing reports of patients experiencing increased intoxicating effects of alcohol while taking CHANTIX. Some cases described unusual and sometimes aggressive behavior, and were often accompanied by amnesia for the events. Advise patients to reduce the amount of alcohol they consume while taking CHANTIX until they know whether CHANTIX affects their tolerance for alcohol [see <i>Adverse Reactions (6.2)</i>].</p>	
<p>5.4 Accidental Injury</p>	<p>There have been postmarketing reports of traffic accidents, near-miss incidents in traffic, or other accidental injuries in patients taking CHANTIX. In some cases, the patients reported somnolence, dizziness, loss of consciousness or difficulty concentrating that resulted in impairment, or concern about potential impairment, in driving or operating machinery. Advise patients to use caution driving or operating machinery or engaging in other potentially hazardous activities until they know how CHANTIX may affect them.</p>	<p><u>Accidental Injury, including while Driving, Operating Machinery</u> There have been post-marketing reports of traffic accidents, near-miss incidents in traffic, and other accidental injuries in patients taking varenicline. In some cases, the patients reported somnolence, dizziness, loss of consciousness (blackouts), seizures or difficulty concentrating. Therefore, patients should be advised not to engage in potentially hazardous activities, such as driving a car or operating dangerous machines, until they know how APO-VARENICLINE may affect them.</p>
<p>5.5 Cardiovascular Events</p>	<p>A comprehensive evaluation of cardiovascular (CV) risk with CHANTIX suggests that patients with underlying CV disease may be at increased risk; however, these concerns must be balanced with the health benefits of smoking cessation. CV risk has been assessed for CHANTIX in randomized controlled trials (RCT) and meta-analyses of RCTs. In a smoking cessation trial in patients with stable CV disease, CV events were infrequent overall; however, nonfatal myocardial infarction (MI) and nonfatal stroke occurred more frequently in patients treated with CHANTIX compared to placebo. All-cause and CV mortality was lower in patients treated with CHANTIX [see <i>Clinical Studies (14.8)</i>]. This study was included in a meta-analysis of 15 CHANTIX efficacy trials in various clinical populations that showed an increased hazard ratio for Major Adverse Cardiovascular Events (MACE) of 1.95; however, the finding was not statistically significant (95% CI: 0.79, 4.82). In the large postmarketing neuropsychiatric safety outcome trial, an analysis of adjudicated MACE events was conducted for patients while in the trial and during a 28-week non-treatment extension period. Few MACE events occurred during the trial; therefore, the findings did not contribute substantively to the understanding of CV risk with CHANTIX. Instruct patients to notify their healthcare</p>	<p><u>Cardiovascular Events</u> In a placebo-controlled smoking cessation clinical trial in patients with stable cardiovascular disease (CVD), patients were treated with varenicline 1 mg BID or placebo for 12 weeks, and then followed for another 40 weeks. There were approximately 350 patients per arm. Serious cardiovascular (CV) events that were reported more frequently in varenicline compared to placebo (difference > 2 subjects) were: non-fatal myocardial infarctions (4 vs. 1, on-treatment phase) and need for coronary revascularization (7 vs. 2, post-treatment phase). The total number of patients that experienced serious CV events in varenicline compared to placebo was: 10 vs. 9 on treatment phase, 16 vs. 11 post-treatment phase, for a total of 25 vs. 20 over the 52 week duration. The serious CV events occurring during the treatment and post-treatment phases were adjudicated by an independent blinded committee. The study was powered for assessing efficacy (i.e. quit rates) but not for assessing differences in the occurrence of serious CV events between varenicline and placebo. Therefore, the study was not large enough to allow conclusions regarding the difference in the incidence of CV events reported in the two arms (See also ADVERSE EVENTS, Clinical Trial in Special Populations; and ACTION AND CLINICAL PHARMACOLOGY, Special Population). Physicians are to inform patients of the</p>

Side-by-Side Comparison Table

	<p>providers of new or worsening CV symptoms and to seek immediate medical attention if they experience signs and symptoms of MI or stroke [see <i>Clinical Studies (14.10)</i>].</p>	<p>symptoms of a heart attack and stroke, and instruct them to get emergency medical help right away if they experience any of these symptoms (see also Patient Counseling Information).</p> <p>The CV safety of varenicline was also evaluated in the Cardiovascular Safety Assessment Study in subjects with and without a history of psychiatric disorder that randomized subjects 1:1:1:1 to varenicline 1 mg BID, bupropion SR 150 mg BID, nicotine replacement therapy patch (NRT) 21 mg/day with taper or placebo for a treatment period of 12 weeks. Subjects were then followed post-treatment through a period of up to a total of 52 weeks (See ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions, Cardiovascular Safety Assessment Study in Subjects with and without a History of Psychiatric Disease). Major CV events (CV death, non-fatal MI, non-fatal stroke) were infrequent overall (1/2016 and 4/2014, for patients treated with varenicline and placebo, respectively) during the treatment period. However, because of the relatively low number of events overall and the lack of power for assessing differences between varenicline and placebo, an association between the use of varenicline and an increased risk of CV adverse events cannot be entirely ruled out.</p> <p>Varenicline has not been studied in patients with unstable cardiovascular disease or those with cardiovascular events occurring within two months before study screening. Patients should be advised to notify a health care provider of new or worsening symptoms of cardiovascular disease. The risks of APO-VARENICLINE should be weighed against the benefits of its use in smokers with cardiovascular disease. Smoking is an independent and major risk factor for cardiovascular disease. Varenicline has been demonstrated to increase the likelihood of abstinence from smoking for as long as one year compared to treatment with placebo.</p>
	<p>5.6 Somnambulism</p> <p>Cases of somnambulism have been reported in patients taking CHANTIX. Some cases described harmful behavior to self, others, or property. Instruct patients to discontinue CHANTIX and notify their healthcare provider if they experience somnambulism [see <i>Adverse Reactions (6.2)</i>].</p>	<p><u>Somnambulism</u></p> <p>Cases of somnambulism have been reported post-marketing in patients taking varenicline. Some cases described harmful behavior to self, others, or property. Instruct patients to discontinue APO-VARENICLINE and notify their healthcare provider if they experience somnambulism.</p>
	<p>5.7 Angioedema and Hypersensitivity Reactions</p> <p>There have been postmarketing reports of hypersensitivity reactions including angioedema in patients treated with CHANTIX [see <i>Adverse Reactions (6.2), Patient Counseling Information (17)</i>]. Clinical signs included swelling of the face, mouth (tongue, lips, and gums), extremities, and neck (throat and larynx). There were infrequent reports of life-threatening angioedema requiring emergent medical attention due to respiratory compromise. Instruct patients to discontinue CHANTIX and immediately seek medical care if they experience these symptoms.</p>	<p><u>Angioedema and Hypersensitivity reactions</u></p> <p>There have been post-marketing reports of hypersensitivity reactions, including angioedema, in patients treated with varenicline (see ADVERSE REACTIONS, Post-Marketing Experience). Clinical signs included swelling of the face, mouth (tongue, lips and gums), neck (pharynx and larynx) and extremities. There were rare reports of life-threatening angioedema requiring urgent medical attention due to respiratory compromise. Patients experiencing these symptoms should be instructed to discontinue treatment with APO-VARENICLINE and contact a healthcare provider immediately.</p>
	<p>5.8 Serious Skin Reactions</p> <p>There have been postmarketing reports of rare but serious skin reactions, including Stevens-Johnson Syndrome and erythema multiforme, in patients using CHANTIX [see <i>Adverse Reactions (6.2)</i>]. As these skin reactions can be life-threatening, instruct patients to stop taking CHANTIX and contact a healthcare provider immediately at the first appearance of a skin rash with mucosal lesions or any other signs of hypersensitivity.</p>	<p><u>Serious Skin Reactions</u></p> <p>There have also been post-marketing reports of rare but severe cutaneous reactions, including Stevens-Johnson syndrome and erythema multiforme, in patients using varenicline (see ADVERSE REACTIONS, Post-Marketing Experience). As these skin reactions can be life-threatening, patients should be instructed to discontinue treatment at the first sign of rash or skin reaction and contact a healthcare provider immediately.</p>
	<p>5.9 Nausea</p> <p>Nausea was the most common adverse reaction reported with CHANTIX treatment.</p>	<p><u>Nausea</u></p> <p>Nausea was the most common adverse event associated with varenicline treatment.</p>

Side-by-Side Comparison Table

	<p>Nausea was generally described as mild or moderate and often transient; however, for some patients, it was persistent over several months. The incidence of nausea was dose-dependent. Initial dose-titration was beneficial in reducing the occurrence of nausea. For patients treated to the maximum recommended dose of 1 mg twice daily following initial dosage titration, the incidence of nausea was 30% compared with 10% in patients taking a comparable placebo regimen. In patients taking CHANTIX 0.5 mg twice daily following initial titration, the incidence was 16% compared with 11% for placebo. Approximately 3% of patients treated with CHANTIX 1 mg twice daily in studies involving 12 weeks of treatment discontinued treatment prematurely because of nausea. For patients with intolerable nausea, a dose reduction should be considered.</p>	<p>Nausea was generally described as mild or moderate and often transient; however, for some subjects, it was persistent over several months. The incidence of nausea was dose-dependent. Initial dose-titration was beneficial in reducing the occurrence of nausea. Nausea was reported by approximately 30% of patients treated with varenicline 1 mg BID after an initial week of dose titration. In patients taking varenicline 0.5 mg BID, the incidence of nausea was 16% following initial titration. Approximately 3% of subjects treated with varenicline 1 mg BID in studies involving 12 weeks of treatment discontinued treatment prematurely because of nausea. For patients with intolerable nausea, dose reduction should be considered (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment).</p>
<p>Adverse Reactions</p>	<p>6 ADVERSE REACTIONS</p> <p>The following serious adverse reactions were reported in postmarketing experience and are discussed in greater detail in other sections of the labeling:</p> <ul style="list-style-type: none"> • Neuropsychiatric Adverse Events including Suicidality [see <i>Warnings and Precautions (5.1)</i>] • Seizures [see <i>Warnings and Precautions (5.2)</i>] • Interaction with Alcohol [see <i>Warnings and Precautions (5.3)</i>] • Accidental Injury [see <i>Warnings and Precautions (5.4)</i>] • Cardiovascular Events [see <i>Warnings and Precautions (5.5)</i>] • Somnambulism [see <i>Warnings and Precautions (5.6)</i>] • Angioedema and Hypersensitivity Reactions [see <i>Warnings and Precautions (5.7)</i>] • Serious Skin Reactions [see <i>Warnings and Precautions (5.8)</i>] <p>In the placebo-controlled premarketing studies, the most common adverse events associated with CHANTIX (>5% and twice the rate seen in placebo-treated patients) were nausea, abnormal (vivid, unusual, or strange) dreams, constipation, flatulence, and vomiting.</p> <p>The treatment discontinuation rate due to adverse events in patients dosed with 1 mg twice daily was 12% for CHANTIX, compared to 10% for placebo in studies of three months' treatment. In this group, the discontinuation rates that are higher than placebo for the most common adverse events in CHANTIX-treated patients were as follows: nausea (3% vs. 0.5% for placebo), insomnia (1.2% vs. 1.1% for placebo), and abnormal dreams (0.3% vs. 0.2% for placebo).</p> <p>Smoking cessation, with or without treatment, is associated with nicotine withdrawal symptoms and has also been associated with the exacerbation of underlying psychiatric illness.</p>	
	<p>6.1 Clinical Trials Experience</p> <p>Because clinical trials are conducted under widely varying conditions, the adverse reactions rates observed in the clinical studies of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.</p> <p>During the premarketing development of CHANTIX, over 4500 subjects were exposed to CHANTIX, with over 450 treated for at least 24 weeks and approximately 100 for a year.</p>	<p>Clinical Trial Adverse Drug Reactions</p> <p>Smoking-cessation with or without treatment is associated with various symptoms. For example, dysphoric or depressed mood, insomnia, irritability, frustration or anger, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite or weight gain have been reported in patients attempting to stop smoking.</p> <p>Overview</p> <p>Pre-marketing clinical trials included approximately 2300 patients treated for at least 12 weeks, approximately 700 for 6 months, and approximately 100 for one year. In general, onset of adverse events was in the first few weeks of therapy and severity</p>

Side-by-Side Comparison Table

	<p>Most study participants were treated for 12 weeks or less.</p> <p>The most common adverse event associated with CHANTIX treatment is nausea, occurring in 30% of patients treated at the recommended dose, compared with 10% in patients taking a comparable placebo regimen [see <i>Warnings and Precautions (5.9)</i>].</p> <p>Table 1 shows the adverse events for CHANTIX and placebo in the 12- week fixed dose premarketing studies with titration in the first week [Studies 2 (titrated arm only), 4, and 5]. Adverse events were categorized using the Medical Dictionary for Regulatory Activities (MedDRA, Version 7.1).</p> <p>MedDRA High Level of patients in the CHANTIX 1 mg twice daily dose group, and more commonly than in the placebo group, are listed, along with subordinate Preferred Terms patients (and at least 0.5% more frequent than placebo). Closely related Preferred Terms such as 'Insomnia', 'Initial insomnia', 'Middle insomnia', 'Early morning awakening' were grouped, but individual patients reporting two or more grouped events are only counted once.</p>	<p>was generally mild to moderate. No differences were observed by age, race or gender with regard to the incidence of adverse reactions, although patient numbers in elderly, and in non-caucasian races were too limited to allow conclusions.</p> <p>Commonly Observed Adverse Events The most commonly observed adverse events associated with varenicline (> 5% and twice the rate seen in placebo-treated patients) were nausea, abnormal dreams, constipation, flatulence, and vomiting.</p> <p>For patients exposed to the maximum recommended dose of 1 mg BID following initial dosage titration, the incidence of nausea was 30%, compared with 16% in 0.5 mg BID and approximately 10% in placebo-treated patients. Nausea was generally described as mild to moderate and often transient; however, for some subjects, it was persistent throughout the treatment period.</p> <p>Adverse Events Leading to Discontinuation In Phase 2 and 3 placebo-controlled studies, the treatment discontinuation rate due to adverse events in patients randomized to 12 weeks treatment with the recommended maximum dose of 1 mg BID was 12% for varenicline compared to 10% for placebo. In this group, the adverse events most frequently resulting in treatment discontinuation in varenicline treated patients were as follows: nausea (2.7% vs 0.6% for placebo), insomnia (1.3% vs 1.2% for placebo), fatigue/malaise/asthenia (1.0% vs 0.5% for placebo), and dizziness (0.7% vs 0.4% for placebo).</p> <p>Table 1 shows the adverse events for varenicline and placebo in the 12-week fixed dose studies with titration in the first week (Studies 1 (titrated arm only), 3, and 4).</p> <p>5% of patients in the varenicline 1 mg BID dose group, and more commonly than in the placebo group, 1% of varenicline patients (and at least 0.5% more frequently than placebo). Closely related Preferred Terms such as 'Insomnia', 'Initial insomnia', 'Middle insomnia', 'Early morning awakening' were grouped, but individual patients reporting two or more grouped events were only counted once.</p>

NEC: Not Elsewhere Classified

The overall pattern and frequency of adverse events during the longer-term premarketing trials was similar to those described in Table 1, though several of the most common events were reported by a greater proportion of patients with long-term use (e.g., nausea was reported in 40% of patients treated with CHANTIX 1 mg twice daily in a one year study, compared to 8% of placebo-treated patients).

Following is a list of treatment-emergent adverse events reported by patients treated with CHANTIX during all premarketing clinical trials and updated based on pooled data from 18 placebo-controlled pre- and postmarketing studies, including approximately

Additional Clinical Trial Adverse Drug Reactions

The adverse drug reactions listed below are based on evaluation of data from pre-marketing phase 2-3 studies and updated based on a pooled database of a total of 18 placebo-controlled, pre- and post-marketing smoking cessation studies, with approximately 5,000 patients treated with varenicline. All reported events are included except those already listed in Table 1, those too general to be informative, and those not reasonably possibly associated with the use of the drug. In some cases, separate event terms have been consolidated to facilitate meaningful presentation. It is important to emphasize that although the events reported occurred

Side-by-Side Comparison Table

	<p>5,000 patients treated with varenicline. Adverse events were categorized using MedDRA, Version 16.0. The listing does not include those events already listed in the previous tables or elsewhere in labeling, those events for which a drug cause was remote, those events which were so general as to be uninformative, and those events reported only once which did not have a substantial probability of being acutely life-threatening.</p>	<p>during treatment with varenicline they were not necessarily caused by it. The ADRs listed below are presented by the Medical Dictionary for Regulatory Activities (MedDRA, Version 16) System Organ Class (SOC). The variability associated with adverse event reporting and the terminology used to describe adverse events limit the value of the quantitative frequency estimates provided. Events are further classified within system organ class categories and enumerated in order of decreasing frequency using the following definitions: very frequent (occurring in at least 1/10 patients), frequent (occurring in at least 1/100 patients), infrequent (occurring in < 1/100 to 1/1000 patients) and rare (occurring in fewer than 1/1000 patients).</p>
	<p>Blood and Lymphatic System Disorders. <i>Infrequent:</i> anemia, lymphadenopathy. <i>Rare:</i> leukocytosis, splenomegaly, thrombocytopenia.</p> <p>Cardiac Disorders. <i>Infrequent:</i> angina pectoris, myocardial infarction, palpitations, tachycardia. <i>Rare:</i> acute coronary syndrome, arrhythmia, atrial fibrillation, bradycardia, cardiac flutter, cor pulmonale, coronary artery disease, ventricular extrasystoles.</p> <p>Ear and Labyrinth Disorders. <i>Infrequent:</i> tinnitus, vertigo. <i>Rare:</i> deafness, Meniere's disease.</p> <p>Endocrine Disorders. <i>Infrequent:</i> thyroid <p>CHANTIX has also been studied in postmarketing trials including (1) a trial conducted in patients with chronic obstructive pulmonary disease (COPD), (2) a trial conducted in generally healthy patients (similar to those in the premarketing studies) in which they were allowed to select a quit date between days 8 and 35 of treatment (“alternative quit date instruction trial”), (3) a trial conducted in patients who did not succeed in stopping smoking during prior CHANTIX therapy, or who relapsed after treatment (“re-treatment trial”), (4) a trial conducted in patients with stable cardiovascular disease, (5) a trial conducted in patients with stable schizophrenia or schizoaffective disorder, (6) a trial conducted in patients with major depressive disorder, (7) a postmarketing neuropsychiatric safety outcome trial in patients without or with a history of psychiatric disorder, (8) a non-treatment extension of the postmarketing neuropsychiatric safety outcome trial that assessed CV safety, (9) a trial in patients who were not able or willing to quit abruptly and who were instructed to quit gradually (“gradual approach to quitting smoking trial”).</p> <p>Adverse events in the trial of patients with COPD (1), in the alternative quit date instruction trial (2), and in the gradual approach to quitting smoking trial (9) were similar to those observed in premarketing studies. In the re-treatment trial (3), the profile of common adverse events was similar to that previously reported, but, in addition, varenicline-treated patients also commonly reported diarrhea (6% vs. 4% in placebo-treated patients), depressed mood disorders and disturbances (6% vs. 1%), and other mood disorders and disturbances (5% vs. 2%).</p> <p>In the trial of patients with stable cardiovascular disease (4), more types and a greater number of cardiovascular events were reported compared to premarketing studies, as shown in Table 1 and in Table 2 below.</p>	<p>Cardiovascular Adverse Events in Pooled Clinical Studies of Varenicline</p> <p>In pooled data of 14 completed randomized double-blind placebo controlled smoking cessation trials (not including the study in patients with stable cardiovascular disease), the rate of reported treatment-emergent myocardial infarction (MI) or cerebrovascular accident (CVA) related adverse events was: 8 of 3317 (0.24%) patients on varenicline (> 1 mg), compared to 4 of 2542 (0.16%) patients on placebo.</p> <p>Study in patients with Cardiovascular Disease</p> <p>Varenicline was evaluated in a randomized, double-blind, placebo-controlled study of 703 subjects aged 35 to 75 years with stable, documented cardiovascular disease (other than or in addition to hypertension) that had been diagnosed for more than 2 months. Patients were treated with varenicline 1 mg BID or placebo for 12 weeks, and then followed for another 40 weeks post-treatment (See WARNINGS AND PRECAUTIONS, Cardiovascular Events).</p> <p>There are two partially overlapping data sets of cardiovascular events from the study:</p> <ol style="list-style-type: none"> i) Treatment-emergent CV AEs captured via standard clinical trial AE reporting, while on drug treatment, (including, 30 days post-dose); and ii) Pre-specified serious CV events that were adjudicated by an independent blinded committee captured throughout the 52 week duration (i.e., both “on-treatment” [including 30 days post-dose], and “post-treatment”). <p>The study was powered for assessing efficacy (i.e. quit rates) but not for assessing differences in the occurrence of serious CV events between varenicline and placebo. More cardiovascular events were reported in both arms compared to other studies, as expected due to underlying conditions.</p> <p>Treatment-emergent cardiovascular events which occurred within 30 days after the last dose, and in at least 3 subjects in either arm, are shown in Table 5.</p>

Side-by-Side Comparison Table

Table 2. Cardiovascular Mortality and Nonfatal Cardiovascular Events (%) with a Frequency >1% in Either Treatment Group in the Trial of Patients with Stable Cardiovascular Disease

	CHANTIX 1 mg BID N=353	Placebo N=350
Adverse Events ≥1% in either treatment group		
<i>Up to 30 days after treatment</i>		
Angina pectoris	3.7	2.0
Chest pain	2.5	2.3
Peripheral edema	2.0	1.1
Hypertension	1.4	2.6
Palpitations	0.6	1.1
Adjudicated Cardiovascular Mortality (up to 52 weeks)		
Adjudicated Nonfatal Serious Cardiovascular Events ≥1% in either treatment group		
<i>Up to 30 days after treatment</i>		
Nonfatal MI	1.1	0.3
Hospitalization for angina pectoris	0.6	1.1
<i>Beyond 30 days after treatment and up to 52 weeks</i>		
Need for coronary revascularization*	2.0	0.6
Hospitalization for angina pectoris	1.7	1.1
New diagnosis of peripheral vascular disease (PVD) or admission for a PVD procedure	1.4	0.6

*some procedures were part of management of nonfatal MI and hospitalization for angina

Table 5: Treatment-Emergent Cardiovascular Events that occurred within 30 days after the last dose and in at least 3 subjects in any treatment arm

Cardiovascular Adverse Events	Varenicline (N = 353)	Placebo (N = 350)
Palpitations	2 (0.6)	4 (1.1)

The adjudicated serious cardiovascular events are shown below in **Table 6**.

Patients are counted only once within each row per study phase.

As shown in **Table 6**, the individual serious cardiovascular (CV) events that were reported more frequently in varenicline compared to placebo (difference > 2 subjects) were: non-fatal myocardial infarctions (4 vs. 1, on-treatment phase) and need for coronary revascularization (7 vs. 2, post-treatment phase). Some of the patients requiring coronary revascularization underwent the procedure as part of management of nonfatal MI and hospitalization for angina.

Table 6: Summary of Adjudicated Cardiovascular Events (including CV death) over the 52 Weeks of the Study

	Varenicline N=353			Placebo N= 350		
	Study Treatment Phase	Study Post- Treatment Follow- Up Phase	Total Study Duration (52 Weeks)	Study Treatment Phase	Study Post- Treatment Follow-Up Phase	Total Study Duration (52 Weeks)
Number of subjects with CV event, n (%)						
# of subjects with at least 1 CV event (including CV death)	10 (2.8)	16 (4.5)	25 (7.1)	9 (2.6)	11 (3.1)	20 (5.7)
Types of CV Events						
Nonfatal myocardial infarction	4 (1.1)	3 (0.8) ^a	7 (2.0)	1 (0.3)	2 (0.6) ^b	3 (0.9)
Need for coronary revascularization	1 (0.3)	7 (2.0) ^a	8 (2.3)	1 (0.3)	2 (0.6)	3 (0.9)
Hospitalization for angina pectoris	2 (0.6)	6 (1.7)	8 (2.3)	4 (1.1)	4 (1.1) ^a	8 (2.3)
Hospitalization for congestive heart failure	0 (0)	0 (0)	0 (0)	2 (0.6)	0 (0)	2 (0.6)
Nonfatal stroke	2 (0.6)	0 (0)	2 (0.6)	0 (0)	1 (0.3)	1 (0.3)
Transient ischemic attack	0 (0)	1 (0.3)	1 (0.3)	1 (0.3)	0 (0)	1 (0.3)
New diagnosis of peripheral vascular disease (PVD) or admission for a procedure for the treatment of PVD	1 (0.3)	5 (1.4)	5 (1.4)	1 (0.3)	2 (0.6)	3 (0.9)
Cardiovascular death	0 (0)	1 (0.3) ^a	1 (0.3)	1 (0.3)	1 (0.3)	2 (0.6)

^a one of the events occurred while the subject was taking during the post treatment phase "off-protocol" varenicline or varenicline and other smoking cessation medication.

Varenicline was not studied in patients with unstable cardiovascular disease or those with cardiovascular events occurring within two months before screening. (See also: **WARNINGS AND PRECAUTIONS, Cardiovascular Events, and ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions**)

Cardiovascular Safety Assessment Study in Patients with and without a History of Psychiatric Disorder

The cardiovascular (CV) safety of varenicline was evaluated in the Cardiovascular Safety Assessment Study in subjects with and without a history of psychiatric

Side-by-Side Comparison Table

		<p>disorder. Subjects aged 18 to 75 years, smoking 10 or more cigarettes per day (N=8058) were randomized 1:1:1:1 to varenicline 1 mg BID, bupropion SR 150 mg BID, nicotine replacement therapy patch (NRT) 21 mg/day with taper or placebo for a treatment period of 12 weeks; they were then followed another 12 weeks post-treatment through a period of up to a total of 52 weeks. Of all treated subjects, 1749 (21.7%) had a medium CV risk and 644 (8.0%) had a high CV risk, as defined by Framingham score.</p> <p>Major adverse cardiovascular event (MACE), were defined as cardiovascular death, non-fatal myocardial infarction or non-fatal stroke during treatment. Deaths and cardiovascular events were adjudicated by a blinded, independent committee. The study was not powered for assessing differences between varenicline and placebo in the time to MACE.</p> <p>The following table shows the incidence of MACE for all treatment groups during treatment, and cumulative for treatment plus 30 days and through end of study.</p> <table border="1" data-bbox="1163 548 1814 703"> <thead> <tr> <th></th> <th>Varenicline N=2016</th> <th>Bupropion N=2006</th> <th>NRT N=2022</th> <th>Placebo N=2014</th> </tr> </thead> <tbody> <tr> <td colspan="5"><i>During treatment</i></td> </tr> <tr> <td>MACE, n (%)</td> <td>1 (0.05)</td> <td>2 (0.10)</td> <td>1 (0.05)</td> <td>4 (0.20)</td> </tr> <tr> <td colspan="5"><i>During treatment plus 30 days</i></td> </tr> <tr> <td>MACE, n (%)</td> <td>1 (0.05)</td> <td>2 (0.10)</td> <td>2 (0.10)</td> <td>4 (0.20)</td> </tr> <tr> <td colspan="5"><i>Through end of study</i></td> </tr> <tr> <td>MACE, n (%)</td> <td>3 (0.15)</td> <td>9 (0.45)</td> <td>6 (0.30)</td> <td>8 (0.40)</td> </tr> </tbody> </table> <p>Because of the relatively low number of events overall and the lack of power for assessing differences between varenicline and placebo, an association between the use of varenicline and an increased risk of CV adverse events cannot be entirely ruled out.</p>		Varenicline N=2016	Bupropion N=2006	NRT N=2022	Placebo N=2014	<i>During treatment</i>					MACE, n (%)	1 (0.05)	2 (0.10)	1 (0.05)	4 (0.20)	<i>During treatment plus 30 days</i>					MACE, n (%)	1 (0.05)	2 (0.10)	2 (0.10)	4 (0.20)	<i>Through end of study</i>					MACE, n (%)	3 (0.15)	9 (0.45)	6 (0.30)	8 (0.40)

In the non-treatment extension of the postmarketing neuropsychiatric safety outcomes trial that assessed CV safety (8), the most common adverse events in subjects treated with varenicline and occurring up to 30 days after last dose of treatment were similar to those observed in premarketing studies.		
<p>6.2 Postmarketing Experience</p> <p>The following adverse events have been reported during post-approval use of CHANTIX. Because these events are reported voluntarily from a population of uncertain size, it is not possible to reliably estimate their frequency or establish a causal relationship to drug exposure.</p> <p>There have been reports of depression, mania, psychosis, hallucinations, paranoia, delusions, homicidal ideation, aggression, hostility, anxiety, and panic, as well as suicidal ideation, suicide attempt, and completed suicide in patients attempting to quit smoking while taking CHANTIX [see <i>Warnings and Precautions</i> (5.1)].</p> <p>There have been postmarketing reports of new or worsening seizures in patients treated with CHANTIX [see <i>Warnings and Precautions</i> (5.2)].</p> <p>There have been postmarketing reports of patients experiencing increased intoxicating effects of alcohol while taking CHANTIX. Some reported neuropsychiatric events, including unusual and sometimes aggressive behavior [see <i>Warnings and Precautions</i> (5.1) and (5.3)].</p> <p>There have been reports of hypersensitivity reactions, including angioedema [see <i>Warnings and Precautions</i> (5.7)].</p> <p>There have also been reports of serious skin reactions, including Stevens-Johnson Syndrome and erythema multiforme, in patients taking CHANTIX [see <i>Warnings and Precautions</i> (5.8)].</p> <p>There have been reports of myocardial infarction (MI) and cerebrovascular accident</p>	<p>Post-Marketing Experience</p> <p>The following adverse events have been reported during post-approval use of varenicline. Because these events are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.</p> <p>Psychiatric Symptoms</p> <p>There have been reports of depressed mood, agitation, aggression, hostility, anxiety, changes in behavior or thinking, mania, psychosis, hallucinations, paranoia, delusions, homicidal ideation, mood swings, suicidal ideation and completed suicide in patients attempting to quit smoking while taking varenicline (see WARNINGS AND PRECAUTIONS, Psychiatric Symptoms in Patients with and without Pre-existing Psychiatric Disorder or Symptoms). Of the cases with information provided, the majority reported possible contributing factors, including primarily prior psychiatric history and/or concurrent psychiatric medications. Smoking status at the time of event onset was not reported in most cases. Patients should be advised that drinking alcohol may increase the risk of experiencing psychiatric adverse events. Smoking cessation with or without treatment is associated with nicotine withdrawal symptoms and the exacerbation of underlying psychiatric illness. The role of varenicline in these reports is not known (see also WARNINGS AND PRECAUTIONS, Psychiatric Symptoms in Patients with and without Pre-existing Psychiatric Disorder or Symptoms).</p> <p>Hypersensitivity and Serious Skin Reactions</p> <p>There have also been reports of hypersensitivity reactions, including angioedema and of rare but severe cutaneous reactions including Stevens-Johnson syndrome and erythema multiforme in patients taking varenicline (see WARNINGS AND PRECAUTIONS, Angioedema and Hypersensitivity Reactions and Serious Skin Reactions).</p> <p>Myocardial Infarction and Cerebrovascular Accident</p>	

Side-by-Side Comparison Table

	<p>(CVA) including ischemic and hemorrhagic events in patients taking CHANTIX. In the majority of the reported cases, patients had pre-existing cardiovascular disease and/or other risk factors. Although smoking is a risk factor for MI and CVA, based on temporal relationship between medication use and events, a contributory role of varenicline cannot be ruled out [see <i>Warnings and Precautions</i> (5.5)].</p> <p>There have been reports of hyperglycemia in patients following initiation of CHANTIX.</p> <p>There have been reports of somnambulism, some resulting in harmful behavior to self, others, or property in patients treated with CHANTIX [see <i>Warnings and Precautions</i> (5.6)].</p>	<p>There have been reports of myocardial infarction (MI) and cerebrovascular accident (CVA) including ischemic and hemorrhagic events in patients taking varenicline. In the majority of the reported cases, patients had preexisting cardiovascular disease and/or other risk factors. Although smoking is a risk factor for MI and CVA, a contributory role of varenicline cannot be ruled out, based on temporal relationship between medication use and events.</p> <p>Hyperglycemia and Diabetes Mellitus</p> <p>Smoking cessation, with or without treatment, may be associated with altered glycemic control. There have been reports of hyperglycemia in patients taking varenicline. While the majority of these cases involved diabetic patients experiencing loss of glycemic control (see Special Populations, Patients with Diabetes), there have also been reports of new onset diabetes in patients with no pre-existing diabetes or pre-diabetes.</p>
<p>Drug Interactions</p>	<p>7 DRUG INTERACTIONS</p> <p>Based on varenicline characteristics and clinical experience to date, CHANTIX has no clinically meaningful pharmacokinetic drug interactions [see <i>Clinical Pharmacology</i> (12.3)].</p>	<p><u>DRUG INTERACTIONS</u></p> <p>Overview</p> <p>Based on varenicline pharmacokinetic characteristics, and clinical experience to date, it appears unlikely that varenicline would produce or be subject to clinically meaningful drug interactions.</p> <p>Drug interaction studies were performed with varenicline and: cimetidine, metformin, digoxin, warfarin, transdermal nicotine and bupropion.</p> <p>No clinically meaningful pharmacokinetic drug interactions have been identified, other than potential for interaction with cimetidine in patients with severe renal impairment (see Cimetidine, below).</p>
		<p>Drugs cleared by, or which affect, cytochrome P450 enzymes</p> <p><i>In vitro</i> studies demonstrated that varenicline does not inhibit cytochrome P450 enzymes (IC₅₀ > 6400 ng/mL). The P450 enzymes tested for inhibition were: 1A2, 2A6, 2B6, 2C8, 2C9, 2C19, 2D6, 2E1, and 3A4/5. Also, in human hepatocytes <i>in vitro</i>, varenicline did not induce the activity of cytochrome P450 enzymes 1A2 and 3A4. Therefore, varenicline is unlikely to alter the pharmacokinetics of compounds that are primarily metabolized by cytochrome P450 enzymes.</p> <p>Furthermore, since metabolism of varenicline represents less than 10% of its clearance, drugs known to affect the cytochrome P450 system are unlikely to alter the pharmacokinetics of varenicline (see ACTION AND CLINICAL PHARMACOLOGY: Pharmacokinetics) and therefore a dose adjustment of APO-VARENICLINE should not be required for these types of drugs.</p> <p>Drugs cleared by, or which affect, renal secretion</p> <p><i>In vitro</i> studies demonstrated that varenicline does not inhibit human renal transport proteins at therapeutic concentrations. Therefore, drugs that are cleared by renal secretion (e.g., metformin - see below) are unlikely to be affected by varenicline.</p> <p><i>In vitro</i> studies demonstrated the active renal secretion of varenicline is mediated by the human organic cation transporter, hOCT2. In patients with normal renal function coadministration with inhibitors of hOCT2 does not require a dose adjustment of varenicline as the increase in systemic exposure to varenicline is not expected to be clinically meaningful except in cases of severe renal impairment (see Cimetidine, and Other Inhibitors of hOCT2 below).</p>
	<p>7.1 Use with Other Drugs for Smoking Cessation</p> <p>Safety and efficacy of CHANTIX in combination with other smoking cessation therapies have not been studied.</p>	<p>Use with other therapies for smoking-cessation:</p> <p>Safety and efficacy of varenicline in combination with other smoking-cessation therapies, such as bupropion or nicotine replacement therapy, have not been studied.</p> <p>Bupropion: Varenicline (1 mg BID) did not alter the steady-state pharmacokinetics of bupropion (150 mg BID) in 46 smokers. Steady-state pharmacokinetics of varenicline</p>

Side-by-Side Comparison Table

	<p><u>Bupropion</u></p> <p>Varenicline (1 mg twice daily) did not alter the steady-state pharmacokinetics of bupropion (150 mg twice daily) in 46 smokers. The safety of the combination of bupropion and varenicline has not been established.</p> <p><u>Nicotine replacement therapy (NRT)</u></p> <p>Although co-administration of varenicline (1 mg twice daily) and transdermal nicotine (21 mg/day) for up to 12 days did not affect nicotine pharmacokinetics, the incidence of nausea, headache, vomiting, dizziness, dyspepsia, and fatigue was greater for the combination than for NRT alone. In this study, eight of twenty-two (36%) patients treated with the combination of varenicline and NRT prematurely discontinued treatment due to adverse events, compared to 1 of 17 (6%) of patients treated with NRT and placebo.</p>	<p>remained unchanged by bupropion co-administration.</p> <p>Nicotine replacement therapy (NRT): When varenicline (1 mg BID) and NRT (transdermal, 21 mg/day) were co-administered to 24 smokers for 12 days, there was a statistically significant decrease in average systolic blood pressure (mean 2.6 mmHg) measured on the final day of the study. In this study, the incidence of nausea, headache, vomiting, dizziness, dyspepsia and fatigue were greater for the combination of varenicline and NRT than for NRT alone. Due to the partial agonist nicotinic activity of varenicline, it is not anticipated that co-administration with NRT would confer additional benefits compared with varenicline alone, and may result in increased side effects (see WARNINGS AND PRECAUTIONS).</p> <p>Nicotine replacement therapy (NRT)</p> <p>The concomitant use of NRT with APO-VARENICLINE (varenicline tartrate) may result in an increase in adverse reactions. In a clinical drug interaction study (N=24), the incidences of nausea, headache, vomiting, dizziness, dyspepsia and fatigue were greater for the combination of NRT and varenicline than for NRT alone (see DRUG INTERACTIONS). The safety and efficacy of the combination treatment with varenicline and NRT have not been studied. Due to the proposed mechanism of action of varenicline, it is not anticipated that co-administration with NRT would confer additional benefit compared with varenicline alone.</p>
	<p>7.2 Effect of Smoking Cessation on Other Drugs</p> <p>Physiological changes resulting from smoking cessation, with or without treatment with CHANTIX, may alter the pharmacokinetics or pharmacodynamics of certain drugs (e.g., theophylline, warfarin, insulin) for which dosage adjustment may be necessary.</p>	<p>Effect of smoking-cessation</p> <p>Physiological changes resulting from smoking-cessation, with or without treatment with APO-VARENICLINE, may alter the pharmacokinetics or pharmacodynamics of some drugs for which dosage adjustment may be necessary (examples include theophylline, warfarin and insulin). As smoking induces cytochrome P450 (CYP) isoenzyme 1A2, smoking-cessation may result in an increase of plasma levels of CYP1A2 substrates.</p>
<p>Special Populations</p>	<p>8 USE IN SPECIFIC POPULATIONS</p> <p>8.1 Pregnancy</p> <p><u>Risk Summary</u></p> <p>Available data have not suggested an increased risk for major birth defects following exposure to varenicline in pregnancy, compared with women who smoke [see Data]. Smoking during pregnancy is associated with maternal, fetal, and neonatal risks (see <i>Clinical Considerations</i>). In animal studies, varenicline did not result in major malformations but caused decreased fetal weights in rabbits when dosed during organogenesis at exposures equivalent to 50 times the exposure at the maximum recommended human dose (MRHD). Additionally, administration of varenicline to pregnant rats during organogenesis through lactation produced developmental toxicity in offspring at maternal exposures equivalent to 36 times human exposure at the MRHD [see Data].</p> <p>The estimated background risk of oral clefts is increased by approximately 30% in infants of women who smoke during pregnancy, compared to pregnant women who do not smoke. The background risk of other major birth defects and miscarriage for the indicated population are unknown. In the US general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.</p> <p><u>Clinical Considerations</u></p>	<p>Pregnant Women</p> <p>Studies in animals have shown reproductive toxicity (see TOXICOLOGY). The potential risk for humans is not fully known (See ACTION AND CLINICAL PHARMACOLOGY, Special Populations: Pregnant Women). APO-VARENICLINE should not be used during pregnancy.</p> <p>Pregnant Women</p> <p>A population-based cohort study compared infants exposed to varenicline <i>in utero</i> (N=335) with infants born to mothers who smoked during pregnancy (N=78,412) and infants born to non-smoking mothers (N=806,438). In this study, infants exposed to varenicline <i>in utero</i> were no more likely to have major congenital malformations (3.6%) than infants born to mothers who smoked during pregnancy (4.3%) or to non-smoking mothers (4.2%). Similarly, infants exposed to varenicline <i>in utero</i>, as compared to infants of smoking and non-smoking mothers, were not at increased risk of stillbirth, (0.3%, 0.5%, 0.3%, respectively), small for gestational age (12.5%, 17.1%, 9.1%), preterm birth (7.5%, 7.9%, 5.8%), or premature rupture of membrane (3.6%, 5.4%, 3.8%).</p>

Side-by-Side Comparison Table

	<p><i>Disease-Associated Maternal and/or Embryo/Fetal Risk</i></p> <p>Smoking during pregnancy causes increased risks of orofacial clefts, premature rupture of membranes, placenta previa, placental abruption, ectopic pregnancy, fetal growth restriction and low birth weight, stillbirth, preterm delivery and shortened gestation, neonatal death, sudden infant death syndrome and reduction of lung function in infants. It is not known whether quitting smoking with CHANTIX during pregnancy reduces these risks.</p> <p><u>Data</u></p> <p><i>Human Data</i></p> <p>A population-based observational cohort study using the national registers of Denmark and Sweden compared pregnancy and birth outcomes among women exposed to varenicline (N=335, includes 317 first trimester exposed) with women who smoked during pregnancy (N=78,412) and with non-smoking pregnant women (N=806,438). The prevalence of major malformations, the primary outcome, was similar in all groups, including between smoking and non-smoking groups. The prevalence of adverse perinatal outcomes in the varenicline-exposed cohort was not greater than in the cohort of women who smoked, and differed somewhat between the three cohorts. The prevalences of the primary and secondary outcomes are shown in Table 6.</p>																													
	<p>Table 6. Summary of Primary and Secondary Outcomes for Three Birth Cohorts</p> <table border="1"> <thead> <tr> <th>Outcome</th> <th>Varenicline Cohort (n=335)</th> <th>Smoking Cohort (n=78,412)</th> <th>Non-Smoking Cohort (n=806,438)</th> </tr> </thead> <tbody> <tr> <td>Major congenital malformation*</td> <td>12 / 334 (3.6%)</td> <td>3,382 / 78,028 (4.3%)</td> <td>33,950 / 804,020 (4.2%)</td> </tr> <tr> <td>Stillbirth</td> <td>1 (0.3%)</td> <td>384 (0.5%)</td> <td>2,418 (0.3%)</td> </tr> <tr> <td>Small for gestational age</td> <td>42 (12.5%)</td> <td>13,433 (17.1%)</td> <td>73,135 (9.1%)</td> </tr> <tr> <td>Preterm birth</td> <td>25 (7.5%)</td> <td>6,173 (7.9%)</td> <td>46,732 (5.8%)</td> </tr> <tr> <td>Premature rupture of membranes</td> <td>12 (3.6%)</td> <td>4,246 (5.4%)</td> <td>30,641 (3.8%)</td> </tr> <tr> <td>Sudden infant death syndrome**</td> <td>0/307 (0.0%)</td> <td>51/71,720 (0.1%)</td> <td>58/755,939 (<0.1%)</td> </tr> </tbody> </table> <p>*Included only live births in the cohorts. 	<p>The study limitations include the inability to capture malformations in pregnancies that do not result in a live birth, and possible misclassification of outcome and of exposure to varenicline or to smoking.</p> <p>Other small epidemiological studies of pregnant women exposed to varenicline did not identify an association with major malformations, consistent with the Danish and Swedish observational cohort study. Methodological limitations of these studies include small samples and lack of adequate controls.</p> <p>Overall, available studies cannot definitely establish or exclude any varenicline-associated risk during pregnancy.</p> <p><i>Animal Data</i></p> <p>Pregnant rats and rabbits received varenicline succinate during organogenesis at oral doses up to 15 and 30 mg/kg/day, respectively. While no fetal structural abnormalities occurred in either species, maternal toxicity, characterized by reduced body weight gain, and reduced fetal weights occurred in rabbits at the highest dose (exposures 50 times the human exposure at the MRHD of 1 mg twice daily based on AUC). Fetal weight reduction did not occur in rabbits at exposures 23 times the human exposure at the</p>																													

Side-by-Side Comparison Table

	<p>MRHD based on AUC.</p> <p>In a pre- and postnatal development study, pregnant rats received up to 15 mg/kg/day of oral varenicline succinate from organogenesis through lactation. Maternal toxicity, characterized by a decrease in body weight gain was observed at 15 mg/kg/day (36 times the human exposure at the MRHD based on AUC). However, decreased fertility and increased auditory startle response occurred in offspring at the highest maternal dose of 15 mg/kg/day.</p>	
	<p>8.2 Lactation</p> <p><u>Risk Summary</u></p> <p>There are no data on the presence of varenicline in human milk, the effects on the breastfed infant, or the effects on milk production. In animal studies varenicline was present in milk of lactating rats [see Data]. However, due to species-specific differences in lactation physiology, animal data may not reliably predict drug levels in human milk. The lack of clinical data during lactation precludes a clear determination of the risk of CHANTIX to an infant during lactation; however the developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for CHANTIX and any potential adverse effects on the breastfed child from CHANTIX or from the underlying maternal condition.</p> <p><u>Clinical Considerations</u></p> <p>Because there are no data on the presence of varenicline in human milk and the effects on the breastfed infant, breastfeeding women should monitor their infant for seizures and excessive vomiting, which are adverse reactions that have occurred in adults that may be clinically relevant in breastfeeding infants.</p> <p><u>Data</u></p> <p>In a pre- and postnatal development study, pregnant rats received up to 15 mg/kg/day of oral varenicline succinate through gestation and lactation Mean serum concentrations of varenicline in the nursing pups were 5-22% of maternal serum concentrations.</p>	<p>Nursing Women</p> <p>Animal studies have shown that varenicline can be transferred to nursing pups. It is not known whether varenicline is excreted in human milk. Because many drugs are excreted in human milk and because the potential for adverse reactions in nursing infants from APO-VARENICLINE is unknown, a decision should be made whether to discontinue nursing or to discontinue the drug.</p>
	<p>8.4 Pediatric Use</p> <p>CHANTIX is not recommended for use in pediatric patients 16 years of age or younger because its efficacy in this population was not demonstrated.</p> <p>Single and multiple-dose pharmacokinetics of varenicline have been investigated in pediatric patients aged 12 to 17 years old (inclusive) and were approximately dose proportional over the 0.5 mg to 2 mg daily dose range studied. Steady-state systemic exposure in adolescent patients of bodyweight >55 kg, as assessed by AUC (0-24), was comparable to that noted for the same doses in the adult population. When 0.5 mg BID was given, steady-state daily exposure of varenicline was, on average, higher (by noted in the adult population.</p> <p>The efficacy and safety of varenicline was evaluated in a randomized, double-blind, placebo-controlled study of 312 patients aged 12 to 19 years, who smoked an average of at least 5 cigarettes per day during the 30 days prior to recruitment, had a score of at least 4 on the Fagerstrom Test for Nicotine Dependence scale, and at least one previous failed quit attempt. Patients were stratified by age (12 to 16 years of age, n = 216 and 17</p>	<p>Pediatrics (< 18 years of age)</p> <p>Based on the data submitted and reviewed by Health Canada, the safety and efficacy of varenicline in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use (see WARNINGS AND PRECAUTIONS, Special Populations: Pediatrics).</p>

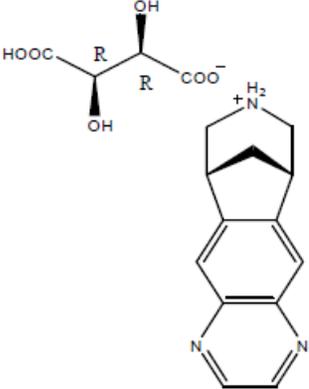

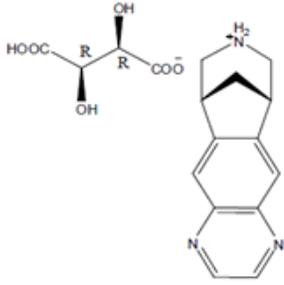

Side-by-Side Comparison Table

	<p>to 19 years of age, n = 96) and by body weight (>55 kg). Patients were randomized to one of two doses of varenicline, adjusted by weight to provide plasma levels in the efficacious range (based on adult studies) and placebo. Patients received treatment for 12 weeks, followed by a non-treatment period of 40 weeks, along with age-appropriate counseling throughout the study. Results from this study showed that varenicline, at either dose studied, did not improve continuous abstinence rates at weeks 9 through 12 of treatment compared with placebo in subjects 12 to 19 years of age. The varenicline safety profile in this study was consistent with that observed in adult studies.</p>	
	<p>8.5 Geriatric Use</p> <p>A combined single- and multiple-dose pharmacokinetic study demonstrated that the pharmacokinetics of 1 mg varenicline given once daily or twice daily to 16 healthy elderly male and female smokers (aged 65-75 years) for 7 consecutive days was similar to that of younger subjects. No overall differences in safety or effectiveness were observed between these subjects and younger subjects, and other reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out.</p> <p>Varenicline is known to be substantially excreted by the kidney, and the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function [see <i>Dosage and Administration</i> (2.2)].</p> <p>No dosage adjustment is recommended for elderly patients.</p>	<p>Geriatrics (> 65 years of age)</p> <p>A combined single and multiple-dose pharmacokinetic study demonstrated that the pharmacokinetics of 1 mg varenicline given once daily (QD) or BID to 16 healthy elderly male and female smokers (aged 65 to 75 years) for 7 consecutive days was similar to that of younger subjects. No overall differences in safety or effectiveness were observed between these subjects and younger subjects, and other reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out.</p> <p>Varenicline is known to be substantially excreted by the kidney, and the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function (see DOSAGE AND ADMINISTRATION, Special Populations: Geriatrics).</p>
	<p>8.6 Renal Impairment</p> <p>Varenicline is substantially eliminated by renal glomerular filtration along with active tubular secretion. Dose reduction is not required in patients with mild to moderate renal impairment. For patients with severe renal impairment (estimated creatinine clearance <30 mL/min), and for patients with end-stage renal disease undergoing hemodialysis, dosage adjustment is needed [see <i>Dosage and Administration</i> (2.2), <i>Clinical Pharmacology</i> (12.3)].</p>	<p>Renal Impairment</p> <p>A multiple dose pharmacokinetic study was conducted in patients with normal renal function, with mild, moderate, or severe renal impairment (estimated creatinine clearance: > 80 mL/min, > 30 mL/min, and < 30 mL/min, respectively) or end-stage renal disease (ESRD). Varenicline pharmacokinetics was unchanged in subjects with mild renal impairment. Relative to subjects with normal renal function, varenicline exposure increased 1.5-fold in patients with moderate renal impairment and 2.1-fold in patients with severe renal impairment. In subjects with ESRD, varenicline was efficiently removed by hemodialysis. The recommended dose of varenicline is reduced in patients with severe renal impairment. APO-VARENICLINE is not recommended in patients with ESRD (see ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions: Renal Impairment, and DOSAGE AND ADMINISTRATION, Special Populations: Patients with Impaired Renal Function).</p>
Drug Abuse Dependence	<p>9 DRUG ABUSE AND DEPENDENCE</p> <p>9.1 Controlled Substance</p> <p>Varenicline is not a controlled substance.</p>	
	<p>9.3 Dependence</p> <p><u>Humans</u></p> <p>Fewer than 1 out of 1,000 patients reported euphoria in clinical trials with CHANTIX. At higher doses (greater than 2 mg), CHANTIX produced more frequent reports of gastrointestinal disturbances such as nausea and vomiting. There is no evidence of dose-escalation to maintain therapeutic effects in clinical studies, which suggests that</p>	<p><u>Dependence/Tolerance</u></p> <p>Human Studies</p> <p>The rewarding potential of varenicline (1 mg and 3 mg doses) was compared with that of amphetamines in subjects experienced with psychomotor stimulants. The pattern for both smokers and non-smokers was consistent with a profile of a drug that, while having some pharmacological activity, did not produce amphetamine-like subjective effects.</p>

Side-by-Side Comparison Table

	<p>tolerance does not develop. Abrupt discontinuation of CHANTIX was associated with an increase in irritability and sleep disturbances in up to 3% of patients. This suggests that, in some patients, varenicline may produce mild physical dependence which is not associated with addiction.</p> <p>In a human laboratory abuse liability study, a single oral dose of 1 mg varenicline did not produce any significant positive or negative subjective responses in smokers. In non-smokers, 1 mg varenicline produced an increase in some positive subjective effects, but this was accompanied by an increase in negative adverse effects, especially nausea. A single oral dose of 3 mg varenicline uniformly produced unpleasant subjective responses in both smokers and non-smokers.</p> <p><u>Animals</u></p> <p>Studies in rodents have shown that varenicline produces behavioral responses similar to those produced by nicotine. In rats trained to discriminate nicotine from saline, varenicline produced full generalization to the nicotine cue. In self-administration studies, the degree to which varenicline substitutes for nicotine is dependent upon the requirement of the task. Rats trained to self-administer nicotine under easy conditions continued to self-administer varenicline to a degree comparable to that of nicotine; however in a more demanding task, rats self-administered varenicline to a lesser extent than nicotine. Varenicline pretreatment also reduced nicotine self-administration.</p>	<p>Animal Studies</p> <p>The subjective nicotine-like effects of varenicline were investigated in drug discrimination studies. At 1 mg/kg, there was complete substitution of varenicline for nicotine in a paradigm of nicotine-associated lever pressing for food reward. In an efficacy model, varenicline pretreatment dose-dependently reduced nicotine self-administration under a fixed-ratio schedule. Under a progressive ratio schedule rats worked harder for nicotine than for varenicline.</p>								
<p>Overdosage</p>	<p>10 OVERDOSAGE</p> <p>In case of overdose, standard supportive measures should be instituted as required.</p> <p>Varenicline has been shown to be dialyzed in patients with end-stage renal disease [see <i>Clinical Pharmacology (12.3)</i>], however, there is no experience in dialysis following overdose.</p>	<p>OVERDOSAGE</p> <p>Symptoms</p> <p>Consistent with its pharmacological profile, varenicline resulted in increased incidences of nausea and vomiting when given at doses greater than the recommended dose of 1 mg BID.</p> <p>Treatment</p> <p>Varenicline has been shown to be dialyzed in patients with end-stage renal disease (see ACTION AND CLINICAL PHARMACOLOGY, <u>Special Populations and Conditions: Renal Insufficiency</u>), however, there is no experience with dialysis following overdose.</p> <div style="border: 1px solid black; padding: 2px;"> <p>For management of a suspected drug overdose, contact your regional Poison Control Centre.</p> </div>								
<p>Description</p>	<p>11 DESCRIPTION</p> <p>CHANTIX tablets contain varenicline (as the tartrate salt), which is a partial nicotinic ₄ ₂ nicotinic acetylcholine receptor subtypes.</p> <p>Varenicline, as the tartrate salt, is a powder which is a white to off-white to slightly yellow solid with the following chemical name: 7,8,9,10-tetrahydro-6,10-methano-6H-pyrazino[2,3- h][3]benzazepine, (2R,3R)-2,3-dihydroxybutanedioate (1:1). It is highly soluble in water. Varenicline tartrate has a molecular weight of 361.35 Daltons, and a molecular formula of C₁₃H₁₃N₃ • C₄H₆O₆. The chemical structure is:</p>	<p>PHARMACEUTICAL INFORMATION</p> <p>Drug Substance</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 30%;">Proper name:</td> <td>Varenicline Tartrate</td> </tr> <tr> <td>Chemical name:</td> <td>7,8,9,10-Tetrahydro-6,10-methano-6H-pyrazino [2,3-h] [3] benzazepine</td> </tr> <tr> <td></td> <td>OR</td> </tr> <tr> <td></td> <td>5,8,14-triazatetracyclo [10.3.1.02,11.04,9]hexadeca-2(11)-3,5,7,9-</td> </tr> </table>	Proper name:	Varenicline Tartrate	Chemical name:	7,8,9,10-Tetrahydro-6,10-methano-6H-pyrazino [2,3-h] [3] benzazepine		OR		5,8,14-triazatetracyclo [10.3.1.02,11.04,9]hexadeca-2(11)-3,5,7,9-

		<p>which it acts as a weak, full agonist (EC50=0.96 mcM). Varenicline-induced nausea shortly after dosing, when gastrointestinal levels are predicted to be temporarily high, may be due to activation of this peripheral receptor, in addition to a possible role for</p> <p style="text-align: center;">4</p>														
	<p>12.3 Pharmacokinetics</p> <p><u>Absorption</u></p> <p>Maximum plasma concentrations of varenicline occur typically within 3-4 hours after oral administration. Following administration of multiple oral doses of varenicline, steady-state conditions were reached within 4 days. Over the recommended dosing range, varenicline exhibits linear pharmacokinetics after single or repeated doses.</p> <p>In a mass balance study, absorption of varenicline was virtually complete after oral administration and systemic availability was ~90%.</p> <p><u>Food Effect</u></p> <p>Oral bioavailability of varenicline is unaffected by food or time-of-day dosing.</p> <p><u>Distribution</u></p> <p>Plasma protein binding of both age and renal function.</p> <p><u>Elimination</u></p> <p>The elimination half-life of varenicline is approximately 24 hours.</p> <p><u>Metabolism</u></p> <p>Varenicline undergoes minimal metabolism, with 92% excreted unchanged in the urine.</p> <p><u>Excretion</u></p> <p>Renal elimination of varenicline is primarily through glomerular filtration along with active tubular secretion possibly via the organic cation transporter, OCT2.</p> <p><u>Specific Populations</u></p> <p>There are no clinically meaningful differences in varenicline pharmacokinetics due to age, race, gender, smoking status, or use of concomitant medications, as demonstrated in specific pharmacokinetic studies and in population pharmacokinetic analyses.</p> <p><u>Age: Geriatric Patients</u></p> <p>A combined single- and multiple-dose pharmacokinetic study demonstrated that the pharmacokinetics of 1 mg varenicline given once daily or twice daily to 16 healthy elderly male and female smokers (aged 65-75 years) for 7 consecutive days was similar to that of younger subjects.</p> <p><u>Age: Pediatric Patients</u></p> <p>CHANTIX is not recommended for use in pediatric patients 16 years of age or younger because its efficacy in this population was not demonstrated [see Use in Specific Populations (8.4)].</p>	<p>Pharmacokinetics</p> <p>Table 7: Summary of Mean with Standard Deviation Varenicline Pharmacokinetic Parameters in Adult Male and Female Smokers</p> <table border="1"> <thead> <tr> <th></th> <th>C_{max} (ng/mL)</th> <th>T_{max}^a (hr)</th> <th>AUC₀₋₂₄ (ng·h/mL)</th> <th>t_{1/2} (hr)</th> <th>Clearance^c (L/hr)</th> <th>Volume of distribution^c (L)</th> </tr> </thead> <tbody> <tr> <td>1 mg ^aBID</td> <td>9.22 (2.05)</td> <td>3.00 [1.00- 8.00]</td> <td>194^d (42.7)</td> <td>33.0^e (14.4)</td> <td>10.4 (25%CV)</td> <td>337 (50%CV)</td> </tr> </tbody> </table> <p><small>^afrom three multiple-dose studies (N=103); ^bN=64; ^cN=46 ^dpresented as median [range] ^eclearance and central volume of distribution estimated from a population PK analysis conducted on pooled data from 1878 subjects (49.2% females); presented as typical value (interindividual coefficient of variation)</small></p> <p>Absorption: Maximum plasma concentrations of varenicline occur typically within 3 to 4 hours after oral administration. Following administration of multiple oral doses of varenicline to healthy volunteers, steady-state conditions were reached within 4 days. Varenicline exhibits linear kinetics when given as single (0.1 to 3 mg) or repeated (1 to 3 mg/day) doses. In a mass balance study,</p> <p>absorption of varenicline is virtually complete after oral administration and systemic availability is high. Oral bioavailability of varenicline is unaffected by food or time-of-day dosing.</p> <p>Distribution: 20%) and independent of both age and renal function.</p> <p>Metabolism: Varenicline tartrate undergoes minimal metabolism, with approximately 92% of recovered drug-related entity in urine being unchanged varenicline. Metabolite profiles (for circulation and urine) were similar for smokers and non-smokers, and are from the following minor routes of metabolism: N-carbonyl glucuronidation, N-formylation and conjugation with a hexose sugar.</p> <p>Elimination: The elimination half-life of varenicline tartrate is approximately 24 hours. Renal elimination of varenicline is the major elimination route, primarily through glomerular filtration along with active tubular secretion via the organic cationic transporter, OCT2.</p> <p>Special Populations and Conditions</p> <p>There were no clinically meaningful differences seen in varenicline tartrate pharmacokinetics due to being elderly, race, gender, smoking status, or use of concomitant medications, as demonstrated in specific pharmacokinetic studies and in population pharmacokinetic analyses.</p> <p>Pediatrics:</p> <p>Based on the data submitted and reviewed by Health Canada, the safety and efficacy of varenicline in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use.</p> <p>Two pharmacokinetic studies have been conducted in adolescent smokers, aged 12 to 17 inclusive: a single dose study (n = 27), and a multiple dose study (n = 72). Pharmacokinetics were approximately dose-proportional over the 0.5 mg to 2 mg daily dose range studied. (see INDICATIONS AND CLINICAL USE, Special population: Pediatrics).</p> <p>Steady-state systemic exposure: In the multiple-dose study, patients were stratified</p>		C _{max} (ng/mL)	T _{max} ^a (hr)	AUC ₀₋₂₄ (ng·h/mL)	t _{1/2} (hr)	Clearance ^c (L/hr)	Volume of distribution ^c (L)	1 mg ^aBID	9.22 (2.05)	3.00 [1.00- 8.00]	194 ^d (42.7)	33.0 ^e (14.4)	10.4 (25%CV)	337 (50%CV)

Side-by-Side Comparison Table

<p>Renal Impairment Varenicline pharmacokinetics were unchanged in subjects with mild renal impairment (estimated $CrCl$ 30-50 mL/min), moderate renal impairment (estimated $CrCl$ 15-30 mL/min), and severe renal impairment (estimated $CrCl$ <15 mL/min). In subjects with mild renal impairment, varenicline exposure increased 1.5-fold compared with subjects with normal renal function (estimated creatinine clearance >80 mL/min). In subjects with severe renal impairment (estimated creatinine clearance <30 mL/min), varenicline exposure was increased 2.1-fold. In subjects with end-stage-renal disease (ESRD) undergoing a three-hour session of hemodialysis for three days a week, varenicline exposure was increased 2.7-fold following 0.5 mg once daily administration for 12 days. The plasma C_{max} and AUC of varenicline noted in this setting were similar to those of healthy subjects receiving 1 mg twice daily [see <i>Dosage and Administration (2.2)</i>, <i>Use in Specific Populations (8.6)</i>]. Additionally, in subjects with ESRD, varenicline was efficiently removed by hemodialysis [see <i>Overdosage (10)</i>].</p> <p>Hepatic Impairment Due to the absence of significant hepatic metabolism, varenicline pharmacokinetics should be unaffected in patients with hepatic impairment.</p> <p>Drug-Drug Interactions</p> <p><i>In vitro</i> studies demonstrated that varenicline does not inhibit the following cytochrome P450 enzymes (IC₅₀ >6400 ng/mL): 1A2, 2A6, 2B6, 2C8, 2C9, 2C19, 2D6, 2E1, and 3A4/5. Also, in human hepatocytes <i>in vitro</i>, varenicline does not induce the cytochrome P450 enzymes 1A2 and 3A4.</p> <p><i>In vitro</i> studies demonstrated that varenicline does not inhibit human renal transport proteins at therapeutic concentrations. Therefore, drugs that are cleared by renal secretion (e.g., metformin [see <i>below</i>]) are unlikely to be affected by varenicline.</p> <p><i>In vitro</i> studies demonstrated the active renal secretion of varenicline is mediated by the human organic cation transporter OCT2. Co-administration with inhibitors of OCT2 (e.g., cimetidine [see <i>below</i>]) may not necessitate a dose adjustment of CHANTIX as the increase in systemic exposure to CHANTIX is not expected to be clinically meaningful. Furthermore, since metabolism of varenicline represents less than 10% of its clearance, drugs known to affect the cytochrome P450 system are unlikely to alter the pharmacokinetics of CHANTIX [see <i>Clinical Pharmacology (12.3)</i>]; therefore, a dose adjustment of CHANTIX would not be required.</p> <p>Drug interaction studies were performed with varenicline and digoxin, warfarin, transdermal nicotine, bupropion, cimetidine, and metformin. No clinically meaningful pharmacokinetic drug-drug interactions have been identified.</p> <p>Metformin When co-administered to 30 smokers, varenicline (1 mg twice daily) did not alter the steady-state pharmacokinetics of metformin (500 mg twice daily), which is a substrate of OCT2. Metformin had no effect on varenicline steady-state pharmacokinetics.</p> <p>Cimetidine Co-administration of an OCT2 inhibitor, cimetidine (300 mg four times daily), with varenicline (2 mg single dose) to 12 smokers increased the systemic exposure of varenicline by 29% (90% CI: 21.5%, 36.9%) due to a reduction in varenicline renal</p>	<p>clearance (estimated $CrCl$ 30 mL/min) in subjects with mild renal impairment (estimated $CrCl$ >80 mL/min) compared with subjects with normal renal function (estimated creatinine clearance >80 mL/min). In subjects with severe renal impairment (estimated creatinine clearance <30 mL/min), varenicline exposure was increased 2.1-fold. In subjects with end-stage-renal disease (ESRD) undergoing a three-hour session of hemodialysis for three days a week, varenicline exposure was increased 2.7-fold following 0.5 mg once daily administration for 12 days. The plasma C_{max} and AUC of varenicline noted in this setting were similar to those of healthy subjects receiving 1 mg twice daily [see <i>Dosage and Administration (2.2)</i>, <i>Use in Specific Populations (8.6)</i>]. Additionally, in subjects with ESRD, varenicline was efficiently removed by hemodialysis [see <i>Overdosage (10)</i>].</p> <p>Geriatrics: A combined single and multiple-dose pharmacokinetic study demonstrated that the pharmacokinetics of 1 mg varenicline given once or twice daily to 16 healthy elderly male and female smokers (aged 65 to 75 years) for 7 consecutive days was similar to that of younger subjects.</p> <p>Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function (see DOSAGE AND ADMINISTRATION, Special Populations: Dosing in Elderly Patients).</p> <p>Hepatic Insufficiency: Due to the absence of significant hepatic metabolism, varenicline tartrate pharmacokinetics should be unaffected in patients with hepatic insufficiency, except in the case that there is accompanying renal compromise (see DOSAGE AND ADMINISTRATION). The potential for clinically meaningful drug interactions between varenicline and metabolic inhibitors/inducers is low.</p> <p>Renal Impairment: Varenicline tartrate pharmacokinetics were studied in subjects with normal, mild, moderate, severe renal impairment and end-stage renal disease (n=6 per arm), following 0.5 mg once daily administration for 12 days. Varenicline pharmacokinetics were essentially unchanged in subjects with mild renal impairment (estimated creatinine clearance >80 mL/min) compared with subjects with normal renal function (estimated creatinine clearance >80 mL/min). In subjects with severe renal impairment (estimated creatinine clearance <30 mL/min), varenicline exposure was increased 2.1-fold. In subjects with end-stage renal disease (ESRD), undergoing a three-hour session of hemodialysis, varenicline exposure was increased 2.7-fold; varenicline was efficiently removed by hemodialysis (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment: Special Populations, Patients with Impaired Renal Function).</p> <p>Drug-drug interaction studies were limited to approximately two-week studies in healthy young adult volunteers who smoked.</p>
--	---

Side-by-Side Comparison Table

	<p>clearance.</p> <p>Digoxin Varenicline (1 mg twice daily) did not alter the steady-state pharmacokinetics of digoxin administered as a 0.25 mg daily dose in 18 smokers.</p> <p>Warfarin Varenicline (1 mg twice daily) did not alter the pharmacokinetics of a single 25 mg dose of (R, S)-warfarin in 24 smokers. Prothrombin time (INR) was not affected by varenicline. Smoking cessation itself may result in changes to warfarin pharmacokinetics [see <i>Drug Interactions (7.2)</i>].</p> <p>Use with Other Drugs for Smoking Cessation Bupropion: Varenicline (1 mg twice daily) did not alter the steady-state pharmacokinetics of bupropion (150 mg twice daily) in 46 smokers [see <i>Drug Interactions (7.1)</i>].</p> <p>NRT: Although co-administration of varenicline (1 mg twice daily) and transdermal nicotine (21 mg/day) for up to 12 days did not affect nicotine pharmacokinetics, the incidence of adverse reactions was greater for the combination than for NRT alone [see <i>Drug Interactions (7.1)</i>].</p>	<p>Single dosing for one of the two drugs: Cimetidine: Co-administration of varenicline (2 mg single dose) with an hOCT2 inhibitor, cimetidine (300 mg four times daily (QID) at steady-state) to 12 smokers increased the systemic exposure of varenicline by 29% (90% CI: 21.5%, 36.9%) due to a reduction in varenicline renal clearance. No dosage adjustment is recommended based on concomitant cimetidine administration in subjects with normal renal function or in patients with mild to moderate renal impairment. In patients with severe renal impairment, the concomitant use of cimetidine and varenicline should be avoided (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment: Special Populations, Patients with Impaired Renal Function). Other inhibitors of hOCT2: Other inhibitors of hOCT2 have not been directly studied. Cimetidine causes greater <i>in vivo</i> drug interactions with renally cleared compounds than other inhibitors of hOCT2. Consequently, co-administration of other inhibitors of hOCT2 with varenicline would not require dosage adjustment in patients with normal renal function or moderate renal impairment. In patients with severe renal impairment, the concomitant use of varenicline and other inhibitors of hOCT2, such as trimethoprim, ranitidine or levofloxacin should be avoided (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment: Special Populations, Patients with Impaired Renal Function). Co-administration with Other Drugs Eliminated via hOCT2: Based on the lack of interaction between varenicline and metformin, interactions between varenicline and other cationic drugs eliminated via hOCT2 are unlikely. Warfarin: Varenicline (1 mg BID steady-state) did not alter the pharmacokinetics of a single 25 mg dose of (R, S)-warfarin in 24 smokers. Prothrombin time (INR) was not affected by varenicline. Smoking-cessation itself may result in changes to warfarin pharmacokinetics (see WARNINGS AND PRECAUTIONS). Multiple dosing for both drugs: Metformin: When co-administered to 30 smokers, varenicline (1 mg BID) did not alter the steady-state pharmacokinetics of metformin (500 mg BID), which is a substrate of hOCT2. Metformin had no effect on varenicline steady-state pharmacokinetics. Digoxin: Varenicline (1 mg BID) did not alter the steady-state pharmacokinetics of digoxin administered as a 0.25 mg daily dose in 18 smokers. Steady-state pharmacokinetics of varenicline remained unchanged by digoxin co-administration.</p>
<p>Nonclinical Toxicology</p>	<p>13 NONCLINICAL TOXICOLOGY</p> <p>13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility</p> <p><u>Carcinogenesis</u></p> <p>Lifetime carcinogenicity studies were performed in CD-1 mice and Sprague-Dawley rats. There was no evidence of a carcinogenic effect in mice administered varenicline by oral gavage for 2 years at doses up to 20 mg/kg/day (47 times the maximum recommended human daily (MRHD) exposure based on AUC). Rats were administered varenicline (1, 5, and 15 mg/kg/day) by oral gavage for 2 years. In male rats (n = 65 per sex per dose group), incidences of hibernoma (tumor of the brown fat) were increased at the mid dose (1 tumor, 5 mg/kg/day, 23 times the MRHD exposure based on AUC) and maximum dose (2 tumors, 15 mg/kg/day, 67 times the MRHD exposure based on AUC). The clinical relevance of this finding to humans has not been established. There was no evidence of carcinogenicity in female rats.</p> <p><u>Mutagenesis</u></p> <p>Varenicline was not genotoxic, with or without metabolic activation, in the following</p>	<p>TOXICOLOGY</p> <p>Carcinogenesis: Lifetime carcinogenicity studies were performed in CD-1 mice and Sprague-Dawley rats. There was no evidence of a carcinogenic effect in mice administered varenicline by oral gavage for 2 years at doses up to 20 mg/kg/day (47 times the maximum recommended human daily exposure based on the area under the curve (AUC). Rats were administered varenicline (1, 5, and 15 mg/kg/day) by oral gavage for 2 years. In male rats (n=65 per sex per dose group), incidences of hibernoma (tumor of the brown fat) was increased at the mid dose (1 tumor, 5 mg/kg/day, 23 times the maximum recommended human daily exposure based on AUC) and at the maximum dose (2 tumors, 15 mg/kg/day, 67 times the maximum recommended human daily exposure based on AUC). The clinical relevance of this finding to humans has not been established. There was no evidence of carcinogenicity in female rats.</p> <p>Mutagenesis: Varenicline was not genotoxic, with or without metabolic activation, in the following assays: Ames bacterial mutation assay; mammalian CHO/HGPRT assay; and</p>

Side-by-Side Comparison Table

	<p>assays: Ames bacterial mutation assay; mammalian CHO/HGPRT assay; and tests for cytogenetic aberrations <i>in vivo</i> in rat bone marrow and <i>in vitro</i> in human lymphocytes.</p> <p><u>Impairment of Fertility</u></p> <p>There was no evidence of impairment of fertility in either male or female Sprague-Dawley rats administered varenicline succinate up to 15 mg/kg/day (67 and 36 times, respectively, the MRHD exposure based on AUC at 1 mg twice daily). Maternal toxicity, characterized by a decrease in body weight gain, was observed at 15 mg/kg/day. However, a decrease in fertility was noted in the offspring of pregnant rats who were administered varenicline succinate at an oral dose of 15 mg/kg/day. This decrease in fertility in the offspring of treated female rats was not evident at an oral dose of 3 mg/kg/day (9 times the MRHD exposure based on AUC at 1 mg twice daily).</p>	<p>tests for cytogenetic aberrations <i>in vivo</i> in rat bone marrow and <i>in vitro</i> in human lymphocytes.</p> <p><u>Sexual Function / Reproduction</u></p> <p>Impairment of Fertility: There was no evidence of impairment of fertility in either male or female Sprague-Dawley rats administered varenicline succinate up to 15 mg/kg/day (67 and 36 times, respectively, the maximum recommended human daily exposure based on AUC at 1 mg BID). However, a decrease in fertility was noted in the offspring of pregnant rats who were administered varenicline succinate at an oral dose of 15 mg/kg/day (36 times the maximum recommended human daily exposure based on AUC at 1 mg BID). This decrease in fertility in the offspring of treated female rats was not evident at an oral dose of 3 mg/kg/day (9 times the maximum recommended human daily exposure based on AUC at 1 mg BID).</p>																																			
<p>Clinical Studies</p>	<p>14 CLINICAL STUDIES</p> <p>The efficacy of CHANTIX in smoking cessation was demonstrated in six clinical trials in treated self-report and verified by measurement of exhaled carbon weekly visits. Among the CHANTIX-treated patients enrolled in these studies, the completion rate was 65%. Except for the dose-ranging study (Study 1) and the maintenance of abstinence study (Study 6), patients were treated for 12 weeks and then were followed for 40 weeks post-treatment. Most patients enrolled in these trials were white (79-96%). All studies enrolled almost equal numbers of men and women. The average age of patients in these studies was 43 years. Patients on average had smoked about 21 cigarettes per day for an average of approximately 25 years. Patients set a date to stop smoking (target quit date) with dosing starting 1 week before this date.</p> <p>Seven additional studies evaluated the efficacy of CHANTIX in patients with cardiovascular disease, in patients with chronic obstructive pulmonary disease [see <i>Clinical Studies (14.7)</i>], in patients instructed to select their quit date within days 8 and 35 of treatment [see <i>Clinical Studies (14.4)</i>], patients with major depressive disorder [see <i>Clinical Studies (14.9)</i>], patients who had made a previous attempt to quit smoking with CHANTIX, and either did not succeed in quitting or relapsed after treatment [see <i>Clinical Studies (14.6)</i>], in patients without or with a history of psychiatric disorder enrolled in a postmarketing neuropsychiatric safety outcome trial [see <i>Warnings and Precautions (5.1), Clinical Studies (14.10)</i>], and in patients who were not able or willing to quit abruptly and were instructed to quit gradually [see <i>Clinical studies (14.5)</i>].</p> <p>In all studies, patients were provided with an educational booklet on smoking cessation and received up to 10 minutes of smoking cessation counseling at each weekly treatment visit according to Agency for Healthcare Research and Quality guidelines.</p>	<p>CLINICAL TRIALS</p> <p>Comparative Bioavailability Study</p> <p>A randomized, single dose, 2-way crossover comparative bioavailability study, conducted under fasting conditions on healthy male volunteers (N=23). The rate and extent of absorption of varenicline was measured and compared following a single oral dose (1 x 1 mg tablet) of APO-VARENICLINE and CHAMPIX[®]MD (Varenicline). The results are summarized in the following table:</p> <p>Summary table of the comparative bioavailability data for APO-VARENICLINE (fasting conditions)</p> <table border="1" data-bbox="1171 899 1803 1398"> <thead> <tr> <th colspan="5">Varenicline (1 x 1 mg tablet) From Measured Data/Fasting Conditions Geometric Mean Arithmetic Mean (CV %)</th> </tr> <tr> <th>Parameter</th> <th>Test*</th> <th>Reference†</th> <th>Ratio of Geometric Means (%)</th> <th>90% Confidence Interval (%)</th> </tr> </thead> <tbody> <tr> <td>AUC_{0-∞} (µg·h/mL)</td> <td>84786.2 85845.6 (18)</td> <td>85226.9 86268.9 (17)</td> <td>99.5</td> <td>95.2 – 103.9</td> </tr> <tr> <td>AUC_{0-t} (µg·h/mL)</td> <td>88764.3 89978.2 (18)</td> <td>89184.6 90363.8 (17)</td> <td>99.5</td> <td>95.2 – 104.1</td> </tr> <tr> <td>C_{max} (µg/mL)</td> <td>4704.4 4733.7 (13)</td> <td>4811.3 4851.9 (14)</td> <td>97.8</td> <td>93.5 – 102.3</td> </tr> <tr> <td>T_{max}‡ (h)</td> <td>3.00 (1.00 – 4.50)</td> <td>3.00 (1.00– 6.00)</td> <td></td> <td></td> </tr> <tr> <td>T_{1/2}§ (h)</td> <td>17.83 (14)</td> <td>17.83 (17)</td> <td></td> <td></td> </tr> </tbody> </table> <p>* APO-VARENICLINE 1 mg (Apotex Inc.) † CHAMPIX[®]MD (Pfizer Canada Inc.), were purchased in Canada ‡ Expressed as the Median (range) only § Arithmetic means (CV %) only.</p>	Varenicline (1 x 1 mg tablet) From Measured Data/Fasting Conditions Geometric Mean Arithmetic Mean (CV %)					Parameter	Test*	Reference†	Ratio of Geometric Means (%)	90% Confidence Interval (%)	AUC _{0-∞} (µg·h/mL)	84786.2 85845.6 (18)	85226.9 86268.9 (17)	99.5	95.2 – 103.9	AUC _{0-t} (µg·h/mL)	88764.3 89978.2 (18)	89184.6 90363.8 (17)	99.5	95.2 – 104.1	C _{max} (µg/mL)	4704.4 4733.7 (13)	4811.3 4851.9 (14)	97.8	93.5 – 102.3	T _{max} ‡ (h)	3.00 (1.00 – 4.50)	3.00 (1.00– 6.00)			T _{1/2} § (h)	17.83 (14)	17.83 (17)

Side-by-Side Comparison Table

<p><u>Study 1</u></p> <p>This was a six-week dose-ranging study comparing CHANTIX to placebo. This study provided initial evidence that CHANTIX at a total dose of 1 mg per day or 2 mg per day was effective as an aid to smoking cessation.</p> <p><u>Study 2</u></p> <p>This study of 627 patients compared CHANTIX 1 mg per day and 2 mg per day with placebo. Patients were treated for 12 weeks (including one-week titration) and then were followed for 40 weeks post-treatment. CHANTIX was given in two divided doses daily. Each dose of CHANTIX was given in two different regimens, with and without initial dose-titration, to explore the effect of different dosing regimens on tolerability. For the titrated groups, dosage was titrated up over the course of one week, with full dosage achieved starting with the second week of dosing. The titrated and nontitrated groups were pooled for efficacy analysis.</p> <p>Forty-five percent of patients receiving CHANTIX 1 mg per day (0.5 mg twice daily) and 51% of patients receiving 2 mg per day (1 mg twice daily) had CO-confirmed continuous abstinence during weeks 9 through 12 compared to 12% of patients in the placebo group (Figure 1). In addition, 31% of the 1 mg per day group and 31% of the 2 mg per day group were continuously abstinent from one week after TQD through the end of treatment as compared to 8% of the placebo group.</p> <p><u>Study 3</u></p> <p>This flexible-dosing study of 312 patients examined the effect of a patient-directed dosing strategy of CHANTIX or placebo. After an initial one-week titration to a dose of 0.5 mg twice daily, patients could adjust their dosage as often as they wished between 0.5 mg once daily to 1 mg twice daily per day. Sixty-nine percent of patients titrated to the maximum allowable dose at any time during the study. For 44% of patients, the modal dose selected was 1 mg twice daily; for slightly over half of the study participants, the modal dose selected was 1 mg/day or less.</p> <p>Of the patients treated with CHANTIX, 40% had CO-confirmed continuous abstinence during weeks 9 through 12 compared to 12% in the placebo group. In addition, 29% of the CHANTIX group were continuously abstinent from one week after TQD through the end of treatment as compared to 9% of the placebo group.</p> <p><u>Study 4 and Study 5</u></p> <p>These identical double-blind studies compared CHANTIX 2 mg per day, bupropion sustained-release (SR) 150 mg twice daily, and placebo. Patients were treated for 12 weeks and then were followed for 40 weeks post-treatment. The CHANTIX dosage of 1 mg twice daily was achieved using a titration of 0.5 mg once daily for the initial 3 days followed by 0.5 mg twice daily for the next 4 days. The bupropion SR dosage of 150 mg twice daily was achieved using a 3-day titration of 150 mg once daily. Study 4 enrolled 1022 patients and Study 5 enrolled 1023 patients. Patients inappropriate for bupropion treatment or patients who had previously used bupropion were excluded.</p> <p>In Study 4, patients treated with CHANTIX had a superior rate of CO-confirmed abstinence during weeks 9 through 12 (44%) compared to patients treated with bupropion SR (30%) or placebo (17%). The bupropion SR quit rate was also superior to</p>	<p>in five double-blind, placebo-controlled clinical trials in which a total of 4190 chronic cigarette smokers (about 10 cigarettes per day) received varenicline. Patients set a date to stop smoking (target quit date, or TQD) of 1 week after treatment initiation. For four of the studies, the primary outcome was based on 12 weeks of drug treatment, with a subsequent 40 weeks of double-blind assessment, post drug-treatment. Of these four, two included a bupropion SR arm. The fifth study assessed the effect of 12 weeks of double-blind treatment on maintenance of abstinence achieved during a prior 12 weeks of open-label varenicline.</p> <p>The four smoking cessation studies with 12 weeks treatment:</p> <p>Primary objective: A comparison of varenicline to placebo, and additionally in each of the two studies with a bupropion SR arm comparison of varenicline (1 mg BID) to bupropion SR.</p> <p>Primary endpoint: Abstinence Responder rate was defined as % of patients for whom 4-week continuous abstinence from Week 9 through Week 12 (4 Week-Continuous Quit Rate, or 4W-CQR) was recorded. Abstinence from smoking was determined on a weekly basis, by patient self-report and measurement of expired carbon monoxide levels (CO). Abstinence was defined as self-report of not even a puff of a cigarette, and Intent-to-treat population was used, and patients who discontinued drug treatment early were eligible as responders, provided they chose to remain in the study.</p> <p>Key secondary endpoint: Continuous Abstinence Rate (CAR) was defined as the proportion of all patients who reported that they did not smoke (not even a puff of a cigarette) from Week 9 through to Week 52 (i.e., including the 40-week, non-drug treatment period), and had an exhaled 10 ppm.</p> <p><u>Study 1: 12-week randomized dose comparison:</u> This study compared varenicline 0.5 mg BID (n=253) and 1 mg BID (n=253) with placebo (n=121). Each treatment arm had two different regimens - with or without a week of dose titration – in order to explore the effect on tolerability. The titrated and non-titrated groups were pooled for efficacy analysis.</p> <p><u>Study 2: 12-week flexible dose study:</u> This study (n=312) examined the effect of patient-directed dosing strategy of varenicline or placebo. After an initial one week titration to a dose 0.5 mg BID, patients could adjust their dosage as often as they wished between 0.5 mg QD to 1 mg BID. Sixty-nine percent (69%) of patients titrated to the maximum allowable dose at any time during the study. For 44% of patients, the modal dose selected was 1 mg BID; for 52% of the study patients, the modal dose selected was 1 mg/day or less.</p> <p><u>Study 3 and Study 4: Identical 12-week studies with active comparator arm:</u> Two identical double-blinded clinical trials prospectively compared the efficacy of varenicline (1 mg BID) to placebo, and to sustained release bupropion (150 mg BID) in the absence of NRT in smoking-cessation. Patients received treatment for 12 weeks</p>

Side-by-Side Comparison Table

	<p>placebo. In addition, 29% of the CHANTIX group were continuously abstinent from one week after TQD through the end of treatment as compared to 12% of the placebo group and 23% of the bupropion SR group.</p> <p>Similarly in Study 5, patients treated with CHANTIX had a superior rate of CO-confirmed abstinence during weeks 9 through 12 (44%) compared to patients treated with bupropion SR (30%) or placebo (18%). The bupropion SR quit rate was also superior to placebo. In addition, 29% of the CHANTIX group were continuously abstinent from one week after TQD through the end of treatment as compared to 11% of the placebo group and 21% of the bupropion SR group.</p>	<p>and then were followed for a total study duration of 52 weeks. The varenicline dosage of 1 mg BID was achieved using a titration of 0.5 mg once daily for the initial 3 days followed by 0.5 mg BID for the next 4 days. The bupropion dosage of 150 mg BID was achieved using a 3-day titration of 150 mg once daily.</p> <p>Study Results</p> <p>Primary Endpoint</p> <p>In all four studies, the primary endpoint for varenicline (i.e., 4W-CQR from Week 9 to Week 12) demonstrated statistical superiority to placebo and in the subset of the two identical studies, statistical superiority to bupropion SR was also demonstrated with varenicline 1 mg BID dose. No patients were allowed to use NRT during the drug treatment phase, and those who did were considered treatment failures. The 4W-CQR (Weeks 9 to 12) for all four studies are shown in Table 11.</p>

	<p>14.2 Urge to Smoke</p> <p>Based on responses to the Brief Questionnaire of Smoking Urges and the Minnesota Nicotine Withdrawal scale “urge to smoke” item, CHANTIX reduced urge to smoke compared to placebo.</p>	<p>Urge to Smoke and Withdrawal Symptoms</p> <p>Based on the responses to the Brief Questionnaire of Smoking Urges and the Minnesota Nicotine Withdrawal Scale, as measured in the 12-week treatment period, craving and urge to smoke were significantly reduced in patients randomized to varenicline compared to those randomized to placebo, as were negative affect withdrawal symptoms (depressed mood; irritability, frustration, or anger; anxiety; difficulty concentrating).</p>																																																												
	<p>14.3 Long-Term Abstinence</p> <p>Studies 1 through 5 included 40 weeks of post-treatment follow-up. In each study, CHANTIX-treated patients were more likely to maintain abstinence throughout the follow-up period than were patients treated with placebo (Figure 2, Table 8).</p>	<p>Secondary Endpoints:</p> <p>In all four studies, a key secondary endpoint for varenicline (i.e., CAR Week 9 through 52) demonstrated statistical superiority to placebo. The CAR Weeks 9 through 52 for all four studies are shown in Table 12.</p> <p>Maintenance of Abstinence Study</p> <p>The fifth study assessed the benefit of an additional 12 weeks of varenicline therapy on the maintenance of abstinence. Patients received open-label varenicline 1 mg BID for 12 weeks. Patients who were abstinent for 7 continuous days at Week 12 were then randomized to double-blind treatment with either varenicline (1 mg BID, n=602) or placebo (n=604) for an additional 12 weeks, and then followed for a total study duration of 52 weeks.</p> <p>The primary study endpoint was the CO-confirmed CAR (defined as above) from Week 13 through Week 24 in the double-blind treatment phase. A key secondary endpoint was the CAR for Week 13 through Week 52.</p> <p>Superiority to placebo was shown for both the primary and secondary endpoints (see Table 9).</p> <p>The CAR from Week 13 through Week 24 was higher for patients continuing treatment with varenicline (70.6%) than for patients switching to placebo (49.8%). Superiority to placebo was also maintained during the 28-week, post-treatment follow-up (varenicline 44.0% versus placebo 37.1% at Week 52). This study showed the benefit of an additional 12 weeks of treatment with varenicline 1 mg BID for the maintenance of smoking-cessation, compared to placebo. A statistically significant difference was maintained at Week 52, the final week of the study.</p>

	<p>14.4 Alternative Instructions for Setting a Quit Date</p> <p>CHANTIX was evaluated in a double-blind, placebo-controlled trial where patients were instructed to select a target quit date between Day 8 and Day 35 of treatment. Subjects were randomized 3:1 to CHANTIX 1 mg twice daily (N=486) or placebo (N=165) for 12 weeks of treatment and followed for another 12 weeks posttreatment. Patients treated with CHANTIX had a superior rate of CO-confirmed abstinence during weeks 9 through 12 (54%) compared to patients treated with placebo (19%) and from weeks 9 through 24 (35%) compared to subjects treated with placebo (13%).</p>																																																																			
	<p>14.5 Gradual Approach to Quitting Smoking</p> <p>CHANTIX was evaluated in a 52-week double-blind placebo-controlled study of 1,510 subjects who were not able or willing to quit smoking within four weeks, but were willing to gradually reduce their smoking over a 12 week period before quitting. Subjects were</p>																																																																			

Side-by-Side Comparison Table

	<p>randomized to either CHANTIX 1 mg twice daily (N=760) or placebo (N=750) for 24 weeks and followed up post-treatment through week 52. Subjects were instructed to reduce the number of cigarettes smoked by at least 50 percent by the end of the first four weeks of treatment, followed by a further 50 percent reduction from week four to week eight of treatment, with the goal of reaching complete abstinence by 12 weeks. After the initial 12-week reduction phase, subjects continued treatment for another 12 weeks. Subjects treated with CHANTIX had a significantly higher Continuous Abstinence Rate compared with placebo at weeks 15 through 24 (32% vs. 7%) and weeks 15 through 52 (24% vs. 6%).</p>															
	<p>14.6 Re-Treatment Study</p> <p>CHANTIX was evaluated in a double-blind, placebo-controlled trial of patients who had made a previous attempt to quit smoking with CHANTIX, and either did not succeed in quitting or relapsed after treatment. Subjects were randomized 1:1 to CHANTIX 1 mg twice daily (N=249) or placebo (N=245) for 12 weeks of treatment and followed for 40 weeks post-treatment. Patients included in this study had taken CHANTIX for a smoking-cessation attempt in the past (for a total treatment duration of a minimum of two weeks), at least three months prior to study entry, and had been smoking for at least four weeks.</p> <p>Patients treated with CHANTIX had a superior rate of CO-confirmed abstinence during weeks 9 through 12 (45%) compared to patients treated with placebo (12%) and from weeks 9 through 52 (20%) compared to subjects treated with placebo (3%).</p>	<p>Patients Re-treated with Varenicline</p> <p>Varenicline was evaluated in a double-blind, placebo-controlled trial of 494 patients who had made a previous attempt to quit smoking with varenicline, and either did not succeed in quitting or relapsed after treatment. Subjects were randomized 1:1 to varenicline 1 mg BID (n=249) or placebo (n=245) for 12 weeks of treatment and followed for up to 40 weeks post-treatment. Patients included in this study had taken varenicline for a smoking-cessation attempt in the past (for a total treatment duration of a minimum of two weeks), at least three months prior to study entry, and had been smoking for at least four weeks. Quit rates in this study were in the range of those from studies in subjects at their first attempt to quit smoking with varenicline.</p> <p>Adverse events in this one-year study were quantitatively and qualitatively similar to those from studies in subjects at their first attempt to quit with varenicline.</p>

	<p>Following the CVD study, a meta-analysis of 12 weeks treatment duration, including 7002 patients (4190 CHANTIX, 2812 placebo), was conducted to systematically assess the CV safety of CHANTIX. The study in patients with stable CV disease described above was included in the meta-analysis. There were lower rates of</p>																																											

Side-by-Side Comparison Table

	<p>all-cause mortality (CHANTIX 6 [0.14%]; placebo 7 [0.25%]) and CV mortality (CHANTIX 2 [0.05%]; placebo 2 [0.07%]) in the CHANTIX arms compared with the placebo arms in the meta-analysis.</p> <p>The key CV safety analysis included occurrence and timing of a composite endpoint of Major Adverse Cardiovascular Events (MACE), defined as CV death, nonfatal MI, and nonfatal stroke. These events included in the endpoint were adjudicated by a blinded, independent committee. Overall, a small number of MACE occurred in the trials included in the meta-analysis, as described in Table 13. These events occurred primarily in patients with known CV disease.</p>																
	<p>Table 13. Number of MACE cases, Hazard Ratio and Rate Difference in a Meta-Analysis of 15 Clinical Trials Comparing CHANTIX to Placebo*</p> <table border="1" data-bbox="325 516 1136 683"> <thead> <tr> <th></th> <th>CHANTIX N=4190</th> <th>Placebo N=2812</th> </tr> </thead> <tbody> <tr> <td>MACE cases, n (%)</td> <td>13 (0.31%)</td> <td>6 (0.21%)</td> </tr> <tr> <td>Patient-years of exposure</td> <td>1316</td> <td>839</td> </tr> <tr> <td>Hazard Ratio (95% CI)</td> <td colspan="2">1.95 (0.79, 4.82)</td> </tr> <tr> <td>Rate Difference per 1,000 patient-years (95% CI)</td> <td colspan="2">6.30 (-2.40, 15.10)</td> </tr> </tbody> </table> <p>*Includes MACE occurring up to 30 days post-treatment.</p>		CHANTIX N=4190	Placebo N=2812	MACE cases, n (%)	13 (0.31%)	6 (0.21%)	Patient-years of exposure	1316	839	Hazard Ratio (95% CI)	1.95 (0.79, 4.82)		Rate Difference per 1,000 patient-years (95% CI)	6.30 (-2.40, 15.10)		
	CHANTIX N=4190	Placebo N=2812															
MACE cases, n (%)	13 (0.31%)	6 (0.21%)															
Patient-years of exposure	1316	839															
Hazard Ratio (95% CI)	1.95 (0.79, 4.82)																
Rate Difference per 1,000 patient-years (95% CI)	6.30 (-2.40, 15.10)																
	<p>The meta-analysis showed that exposure to CHANTIX resulted in a hazard ratio for MACE of 1.95 (95% confidence interval from 0.79 to 4.82) for patients up to 30 days after treatment; this is equivalent to an estimated increase of 6.3 MACE events per 1,000 patient-years of exposure. The meta-analysis showed higher rates of CV endpoints in patients on CHANTIX relative to placebo across different time frames and pre-specified sensitivity analyses, including various study groupings and CV outcomes. Although these findings were not statistically significant they were consistent. Because the number of events was small overall, the power for finding a statistically significant difference in a signal of this magnitude is low.</p> <p>Additionally, a cardiovascular endpoint analysis was added to the postmarketing neuropsychiatric safety outcome study along with a non-treatment extension, [see <i>Warnings and Precautions (5.5), Adverse Reactions (6.1), Clinical Studies (14.10)</i>].</p>																
	<p>14.9 Subjects with Major Depressive Disorder</p> <p>CHANTIX was evaluated in a randomized, double-blind, placebo-controlled study of subjects aged 18 to 75 years with major depressive disorder without psychotic features (DSM-IV TR). If on medication, subjects were to be on a stable antidepressant regimen for at least two months. If not on medication, subjects were to have experienced a major depressive episode in the past 2 years, which was successfully treated. Subjects were randomized to CHANTIX 1 mg twice daily (N=256) or placebo (N=269) for a treatment of 12 weeks and then followed for 40 weeks post-treatment. Subjects treated with CHANTIX had a superior rate of CO-confirmed abstinence during weeks 9 through 12 (36%) compared to subjects treated with placebo (16%) and from week 9 through 52 (20%) compared to subjects treated with placebo (10%).</p>	<p>Patients with Major Depressive Disorder (See also below: Neuropsychiatric Safety Study in Subjects with and without a History of Psychiatric Disorder)</p> <p>Varenicline was evaluated in a randomized, double-blind, placebo-controlled study of 525 subjects with major depressive disorder without psychotic features (DSM-IV TR), on stable antidepressant treatment and/or who experienced a major depressive episode (which was successfully treated) in the past 2 years. Subjects aged 18 to 75 years were randomized to varenicline 1 mg BID (n=256) or placebo (n=269) for a treatment of 12 weeks and then followed for 40 weeks post-treatment. Quit rates in this study were in the range of those from studies in the general population of smokers.</p> <p>In general, the adverse events in this one-year study were quantitatively and qualitatively similar to those observed in studies in the general population of smokers. The following psychiatric AEs were more frequent in the varenicline group vs placebo: agitation (6.6% vs. 4.1%), depression (6.6% vs. 4.8%), tension (3.5% vs. 3.0%), hostility (2.0% vs. 0.4%) and restlessness (2.0% vs. 1.9%). No overall worsening of depression was observed during the study in neither varenicline or placebo treatment groups.</p> <p>The percentage of subjects with suicidal ideation and/or behavior during treatment were 6.0% and 7.5% respectively for the varenicline and placebo groups and 6.2% vs 5.8%</p>															

Side-by-Side Comparison Table

		<p>for the non-treatment follow-up period. There was one event of intentional self-injury/possible suicide attempt during treatment (Day 73) in a subject with history of alcohol abuse in the placebo group. A possible suicide could not be ruled out in one subject who died by an overdose of illicit drugs 76 days after last dose of study drug in the varenicline group.</p>														
	<p>Table 14. Continuous Abstinence (95% confidence interval), Study in Patients with Major Depressive Disorder (MDD)</p> <table border="1" data-bbox="325 446 1129 537"> <thead> <tr> <th rowspan="2"></th> <th colspan="2">Weeks 9 through 12</th> <th colspan="2">Weeks 9 through 52</th> </tr> <tr> <th>CHANTIX 1 mg BID</th> <th>Placebo</th> <th>CHANTIX 1 mg BID</th> <th>Placebo</th> </tr> </thead> <tbody> <tr> <td>MDD Study</td> <td>36% (30%, 42%)</td> <td>16% (11%, 20%)</td> <td>20% (15%, 25%)</td> <td>10% (7%, 14%)</td> </tr> </tbody> </table> <p>BID = twice daily</p>		Weeks 9 through 12		Weeks 9 through 52		CHANTIX 1 mg BID	Placebo	CHANTIX 1 mg BID	Placebo	MDD Study	36% (30%, 42%)	16% (11%, 20%)	20% (15%, 25%)	10% (7%, 14%)

	<p>14.10 Postmarketing Neuropsychiatric Safety Outcome Trial</p> <p>CHANTIX was evaluated in a randomized, double-blind, active and placebo-controlled trial that included subjects without a history of psychiatric disorder (non-psychiatric cohort, N=3912) and with a history of psychiatric disorder (psychiatric cohort, N=4003). Subjects aged 18-75 years, smoking 10 or more cigarettes per day were randomized 1:1:1:1 to CHANTIX 1 mg BID, bupropion SR 150 mg BID, NRT patch 21 mg/day with taper or placebo for a treatment period of 12 weeks; they were then followed for another 12 weeks post-treatment. [See <i>Warnings and Precautions</i> (5.1)]</p> <p>A composite safety endpoint intended to capture clinically significant neuropsychiatric (NPS) adverse events included the following NPS adverse events: anxiety, depression, feeling abnormal, hostility, agitation, aggression, delusions, hallucinations, homicidal ideation, mania, panic, paranoia, psychosis, irritability, suicidal ideation, suicidal behavior or completed suicide.</p> <p>As shown in Table 15, the use of CHANTIX, bupropion, and NRT in the non-psychiatric cohort was not associated with an increased risk of clinically significant NPS adverse events compared with placebo. Similarly, in the non-psychiatric cohort, the use of CHANTIX was not associated with an increased risk of clinically significant NPS adverse events in the composite safety endpoint compared with bupropion or NRT.</p>	<p>Neuropsychiatric Safety Study in Subjects with and without a History of Psychiatric Disorder (see also WARNING AND PRECAUTIONS, <u>Psychiatric Symptoms in Patients with and without Pre-existing Psychiatric Disorder or Symptoms</u>)</p> <p>Varenicline was evaluated in a randomized, double-blind, active and placebo-controlled study that included subjects with a history of psychiatric disorder (psychiatric cohort, N=4074) and subjects without a history of psychiatric disorder (non-psychiatric cohort, N=3984). Excluded psychiatric disorders included current substance abuse, dementias, impulse control and dissociative disorders. Subjects aged 18 to 75 years, smoking 10 or more cigarettes per day were randomized 1:1:1:1 to varenicline 1 mg BID, bupropion SR 150 mg BID, nicotine replacement therapy patch (NRT) 21 mg/day with taper or placebo for a treatment period of 12 weeks; they were then followed for another 12 weeks post-treatment.</p> <p>The prospective primary safety endpoint was a composite of the following neuropsychiatric (NPS) adverse events (which mapped from 261 MedDRA preferred terms): severe events of anxiety, depression, feeling abnormal, or hostility; and moderate or severe events of agitation, aggression, delusions, hallucinations, homicidal ideation, mania, panic, paranoia, psychosis, suicidal ideation, suicidal behavior or completed suicide.</p> <p>The primary diagnoses in the psychiatric cohort of the study were: Affective Disorders ~70%; Anxiety Disorders ~19%; Psychotic Disorders ~ 10%, and Borderline Personality Disorders ~ 1% with all patients judged to be clinically stable.</p> <p>Table 8 shows the rates of the composite NPS adverse event primary end point by treatment group and the risk differences (RDs) (95% CI) vs placebo in each of the non-psychiatric and psychiatric cohort.</p>

	<p>Cardiovascular Outcome Analysis</p> <p>To obtain another source of data regarding the CV risk of CHANTIX, a cardiovascular endpoint analysis was added to the postmarketing neuropsychiatric safety outcome study along with a non-treatment extension. In the parent study (N=8027), subjects aged 18-75 years, smoking 10 or more cigarettes per day were randomized 1:1:1:1 to CHANTIX 1 mg BID, bupropion SR 150 mg BID, nicotine replacement therapy (NRT) patch 21 mg/day or placebo for a treatment period of 12 weeks; they were then followed for another 12 weeks post-treatment. The extension study enrolled 4590 (57.2%) of the 8027 subjects who were randomized and treated in the parent study and followed them for additional 28 weeks. Of all treated subjects, 1743 (21.7%) had a medium CV risk and 640 (8.0%) had a high CV risk, as defined by Framingham score. Note that one site from the parent study was excluded in the assessment of CV safety and two sites were excluded in the assessment of neuropsychiatric safety.</p> <p>The primary CV endpoint was the time to major adverse CV event (MACE), defined as CV death, nonfatal myocardial infarction or nonfatal stroke during treatment. Deaths and CV events were adjudicated by a blinded, independent committee. Table 18 below shows the incidence of MACE and Hazard Ratios compared to placebo for all randomized subjects exposed to at least 1 partial dose of study treatment in the parent study.</p>																																				
	<p>Table 18. The Incidence of MACE and Hazard Ratios in the Cardiovascular Safety Assessment Trial in Subjects without or with a History of Psychiatric Disorder</p>																																				

Side-by-Side Comparison Table

<p>Patient Counseling Information</p>	<p>17 PATIENT COUNSELING INFORMATION</p> <p><i>See FDA-approved patient labeling (Medication Guide)</i></p> <p><u>Initiate Treatment and Continue to Attempt to Quit if Lapse</u></p> <p>Instruct patients to set a date to quit smoking and to initiate CHANTIX treatment one week before the quit date. Alternatively, the patient can begin CHANTIX dosing and then set a date to quit smoking between days 8 and 35 of treatment. Encourage patients to continue to attempt to quit if they have early lapses after quit day [see <i>Dosage and Administration (2.1)</i>].</p> <p>For patients who are sure that they are not able or willing to quit abruptly, a gradual approach to quitting smoking with CHANTIX may be considered. Patients should begin CHANTIX dosing and reduce smoking during the first 12 weeks of treatment, then quit by the end of that period and continue treatment for an additional 12 weeks for a total of 24 weeks [see <i>Dosage and Administration (2.1)</i>].</p> <p>Encourage patients who are motivated to quit and who did not succeed in stopping smoking during prior CHANTIX therapy for reasons other than intolerability due to adverse events, or who relapsed after treatment to make another attempt with CHANTIX once factors contributing to the failed attempt have been identified and addressed [see <i>Dosage and Administration (2.1), Clinical Studies (14.6)</i>].</p> <p><u>How to Take</u></p> <p>Advise patients that CHANTIX should be taken orally after eating, and with a full glass of water [see <i>Dosage and Administration (2.1)</i>].</p> <p><u>Starting Week Dosage</u></p> <p>Instruct patients on how to titrate CHANTIX, beginning at a dose of 0.5 mg/day. Explain that one 0.5 mg tablet should be taken daily for the first three days, and that for the next four days, one 0.5 mg tablet should be taken in the morning and one 0.5 mg tablet should be taken in the evening [see <i>Dosage and Administration (2.1)</i>].</p> <p><u>Continuing Weeks Dosage</u></p> <p>Advise patients that, after the first seven days, the dose should be increased to one 1 mg tablet in the morning and one 1 mg tablet in the evening [see <i>Dosage and Administration (2.1)</i>].</p>	<p>Patient Counseling Information</p> <p>Consumer Information is included in the package of APO-VARENICLINE dispensed to the patient.</p> <p>Prior to prescribing APO-VARENICLINE, physicians should:</p> <ul style="list-style-type: none"> • Discuss with the patient the expected benefits and risks of APO-VARENICLINE, as well as those of all smoking-cessation options. • Inform the patients that quitting smoking, with or without treatment, may be associated with nicotine withdrawal symptoms (including depression, irritation or agitation) or exacerbation of pre-existing psychiatric disorder. • Encourage the patient to reveal any history of psychiatric disorder prior to initiating treatment. Patients with such history who are trying to stop smoking should be monitored by their physician for new or worsened psychiatric events. • Advise patients: <ul style="list-style-type: none"> – not to engage in potentially hazardous tasks, such as driving a car or operating dangerous machines, until they know how APO-VARENICLINE may affect them. In some cases, patients have reported somnolence, dizziness, loss of consciousness, seizures or difficulty concentrating while driving. – that some people have reported seizures while taking varenicline and encourage them to report any history of seizures or other factors that can lower seizure threshold. Instruct patients to discontinue APO-VARENICLINE and immediately contact a healthcare provider if they experience a seizure while on treatment. – that there have been post-marketing reports of serious neuropsychiatric symptoms in patients being treated with varenicline, including anxiety, psychosis, mood swings, aggression, depressed mood, agitation, hallucinations, hostility, changes in behavior or thinking, suicidal ideation, suicidal behavior and suicide, as well as worsening of pre-existing psychiatric disorder. – that i) new or worse cardiovascular events (heart and stroke) have been reported, primarily in those who already have cardiovascular problems and ii) based on available data, it is not possible to determine whether varenicline increases the risk of cardiovascular events. <p>For those patients receiving APO-VARENICLINE:</p> <ul style="list-style-type: none"> • Patients should be instructed to read the patient information leaflet supplied with every APO-VARENICLINE prescription before starting their APO-VARENICLINE pills. This leaflet is approved by Health Canada and is Part III of the APO-VARENICLINE Product Monograph. 																	

Side-by-Side Comparison Table

<p><u>Dosage Adjustment for CHANTIX or Other Drugs</u></p> <p>Inform patients that nausea and insomnia are side effects of CHANTIX and are usually transient; however, advise patients that if they are persistently troubled by these symptoms, they should notify the prescribing physician so that a dose reduction can be considered.</p> <p>Inform patients that some drugs may require dose adjustment after quitting smoking [see <i>Dosage and Administration (2.1)</i>].</p> <p><u>Counseling and Support</u></p> <p>Provide patients with educational materials and necessary counseling to support an attempt at quitting smoking [see <i>Dosage and Administration (2.1)</i>].</p> <p><u>Neuropsychiatric Adverse Events</u></p> <p>Inform patients that some patients have experienced changes in mood (including depression and mania), psychosis, hallucinations, paranoia, delusions, homicidal ideation, aggression, hostility, agitation, anxiety, and panic, as well as suicidal ideation and suicide when attempting to quit smoking while taking CHANTIX. Instruct patients to discontinue CHANTIX and contact a healthcare professional if they experience such symptoms [see <i>Warnings and Precautions (5.1), Adverse Reactions (6.2)</i>].</p> <p><u>History of Psychiatric Illness</u></p> <p>Encourage patients to reveal any history of psychiatric illness prior to initiating treatment.</p> <p><u>Nicotine Withdrawal</u></p> <p>Inform patients that quitting smoking, with or without CHANTIX, may be associated with nicotine withdrawal symptoms (including depression or agitation) or exacerbation of pre-existing psychiatric illness.</p> <p><u>Seizures</u></p> <p>Encourage patients to report any history of seizures or other factors that can lower seizure threshold. Instruct patients to discontinue CHANTIX and contact a healthcare provider immediately if they experience a seizure while on treatment [see <i>Warnings and Precautions (5.2)</i>].</p> <p><u>Interaction with Alcohol</u></p> <p>Advise patients to reduce the amount of alcohol they consume while taking CHANTIX until they know whether CHANTIX affects their tolerance for alcohol [see <i>Warnings and Precautions (5.3), Adverse Reactions (6.2)</i>].</p> <p><u>Driving or Operating Machinery</u></p> <p>Advise patients to use caution driving or operating machinery until they know how quitting smoking and/or varenicline may affect them [see <i>Warnings and Precautions (5.4)</i>].</p>	<ul style="list-style-type: none"> • Patients should also be provided with educational materials and necessary counselling to support an attempt at quitting smoking, including a review of the overall smoking cessation plan with the physician. • Patients should call government-funded toll-free provincial Quit Lines which can be used to support a quit attempt. • Patients should be informed that there are three choices in setting a quit date when using APO-VARENICLINE, and discuss with their physician which one is best for them. • Patients should be instructed on how to titrate APO-VARENICLINE: <ul style="list-style-type: none"> – Begin at a dose of 0.5 mg per day. Prescribers should explain that one 0.5 mg tablet should be taken daily for the first three days, and then for the next four days, two 0.5 mg tablets should be taken daily: one in the morning and one in the evening. • Following this one week of titration, there are two dosing options: the dose can remain at 0.5 mg twice daily or can go up to 1 mg twice daily, depending on the physician judgment and patient preference. Based on the limited data available, the two doses do not appear different in terms of either quit rates, or rates of serious psychiatric side effects (see DOSAGE AND ADMINISTRATION, Dosing Considerations). – If needed, the dose can be changed depending on how well the patient tolerates APO-VARENICLINE and how effective the doctor and patient consider it is in helping the patient quit smoking. – Patients should be informed that the maximum dose of APO-VARENICLINE is 1 mg twice a day. • Patients should be encouraged to continue in their quit attempt if they have early lapses after their quit date. • Patients should be encouraged to inform friends and family members of their quit attempt which includes treatment with APO-VARENICLINE and ask for their support and help in monitoring for any changes in behavior or thinking that are not typical for the patient. • Patients should be advised that drinking alcohol may increase the risk of experiencing psychiatric adverse events during treatment with APO-VARENICLINE. • <u>Patients with pre-existing psychiatric disorder</u> should be instructed that if they develop worsened or new symptoms, to report these to their healthcare provider; dose adjustments of psychiatric medications or APO-VARENICLINE may be considered. • Patients should be informed that if they experience thoughts, moods or behaviours that are strongly atypical and concerning while on smoking-cessation medication, including APO-VARENICLINE, the medication should be discontinued immediately, urgent medical help sought as needed, and the symptoms reported to their healthcare provider. • Patients should be informed that: <ul style="list-style-type: none"> – they may experience vivid, unusual or strange dreams during treatment with APO-VARENICLINE. – nausea is the most common adverse event associated with varenicline and is usually transient. APO-VARENICLINE should be taken after eating and with a full glass of water. Patients should be advised that if they are persistently troubled by this symptom, a dose reduction may be considered.

Side-by-Side Comparison Table

Medication Guide	CHANTIX® (CHANT-iks) (varenicline) Tablets	P^rAPO-VARENICLINE Varenicline Tablets 0.5 mg and 1 mg varenicline (as varenicline tartrate)												
		<p>Read this information each time you refill your prescription in case new information has been added.</p> <p>This leaflet is part III of a three-part "Product Monograph" published when APO-VARENICLINE was approved for sale in Canada and is designed specifically for Consumers. This leaflet is a summary and will not tell you everything about APO-VARENICLINE. Contact your doctor or pharmacist if you have any questions about the drug.</p>												
	<p>What is the most important information I should know about CHANTIX?</p> <p>When you try to quit smoking, with or without CHANTIX, you may have symptoms that may be due to nicotine withdrawal, including:</p> <table border="1" data-bbox="323 581 1104 721"> <tbody> <tr> <td>• urge to smoke</td> <td>• frustration</td> <td>•restlessness</td> </tr> <tr> <td>• depressed mood</td> <td>• anger</td> <td>•decreased heart rate</td> </tr> <tr> <td>• trouble sleeping</td> <td>• feeling anxious</td> <td>•increased appetite</td> </tr> <tr> <td>• irritability</td> <td>• difficulty concentrating</td> <td>•weight gain</td> </tr> </tbody> </table> <p>Some people have even experienced suicidal thoughts when trying to quit smoking without medication. Sometimes quitting smoking can lead to worsening of mental health problems that you already have, such as depression.</p> <p>Some people have had serious side effects while taking CHANTIX to help them quit smoking, including:</p> <p>New or worse mental health problems, such as changes in behavior or thinking, aggression, hostility, agitation, depressed mood, or suicidal thoughts or actions. Some people had these symptoms when they began taking CHANTIX, and others developed them after several weeks of treatment, or after stopping CHANTIX. These symptoms happened more often in people who had a history of mental health problems before taking CHANTIX, than in people without a history of mental health problems.</p> <p>Stop taking CHANTIX and call your healthcare provider right away if you, your family, or caregiver notice any of these symptoms. Work with your healthcare provider to decide whether you should continue to take CHANTIX. In many people, these symptoms went away after stopping CHANTIX, but in some people symptoms continued after stopping CHANTIX. It is important for you to follow-up with your healthcare provider until your symptoms go away.</p> <p>Before taking CHANTIX, tell your healthcare provider if you have ever had depression or other mental health problems. You should also tell your healthcare provider about any symptoms you had during other times you tried to quit smoking, with or without CHANTIX.</p>	• urge to smoke	• frustration	•restlessness	• depressed mood	• anger	•decreased heart rate	• trouble sleeping	• feeling anxious	•increased appetite	• irritability	• difficulty concentrating	•weight gain	<p>What is the most important information I should know about APO-VARENICLINE?</p> <p>When you try to quit smoking, with or without APO-VARENICLINE, you may have symptoms that may be due to nicotine withdrawal, including</p> <ul style="list-style-type: none"> • the urge to smoke • depressed mood • trouble sleeping • irritability • frustration • anger • feeling anxious • difficulty concentrating • restlessness • decreased heart rate • increased appetite or weight gain. <p>Some people have even experienced suicidal thoughts when trying to quit smoking without medication. Sometimes quitting smoking can lead to worsening of mental health problems that you already have, such as depression.</p> <p>Mental Health Problems</p> <p>Some people have had serious side effects while taking APO-VARENICLINE to help them quit smoking, including changes in behavior or thinking, hostility, agitation, aggression, depressed mood, or suicidal thoughts or actions. These symptoms have occurred in people with previous mental health problems, as well as in those with no previous history. For some people, these symptoms began when they started taking APO-VARENICLINE while for others, they began after several weeks of treatment, or shortly after stopping APO-VARENICLINE.</p> <p>Before taking any quit-smoking treatment, including APO-VARENICLINE, tell your healthcare provider (doctor, pharmacist or nurse):</p> <ul style="list-style-type: none"> • if you have ever had depression or other mental health problems; • about any concerning symptoms you had during other times you tried to quit smoking, with or without medication. <p>Inform your friends and family members of your quit attempt with APO-VARENICLINE and ask for their support and help in monitoring for any changes in behavior or thinking that are not normal.</p> <p>Drinking alcohol may increase the risk of having mental health problems during your treatment with APO-VARENICLINE.</p> <p>Patients with history of mental health problems (e.g. depression, anxiety, schizophrenia): If you have had mental health problems before taking APO-</p>

		<p>VARENICLINE, your healthcare provider will monitor you while you try to quit smoking with APO-VARENICLINE. If you develop worsened or new symptoms, talk to your healthcare provider right away because changing the dose (of APO-VARENICLINE or other medications) may make a difference.</p> <p>All patients/General: If you have thoughts, moods or behaviours that are severe, concerning or very abnormal for you, stop taking APO-VARENICLINE right away, seek medical help, and tell your healthcare provider about your symptoms. In many people, these symptoms went away after stopping APO-VARENICLINE, but not in all. It is important for you to follow up with your healthcare provider until your symptoms go away.</p> <p>Allergic Reactions Some people can have allergic reactions to APO-VARENICLINE. Some of these allergic reactions can be life-threatening and include: swelling of the face, mouth, and throat that can cause trouble breathing. If you have these symptoms, stop taking APO-VARENICLINE and seek immediate emergency medical attention.</p> <p>Serious Skin Reactions Some people can have serious skin reactions while taking APO-VARENICLINE. These can include rash, swelling, redness, and peeling of the skin. Some of these reactions can become life-threatening. If you have a rash with peeling skin or blisters in your mouth, around the eyes or genitals, stop taking APO-VARENICLINE and seek immediate emergency medical attention.</p>						
	<p>What is CHANTIX?</p> <p>CHANTIX is a prescription medicine to help people stop smoking. Quitting smoking can lower your chances of having lung disease, heart disease or getting certain types of cancer that are related to smoking. CHANTIX has not been shown to be effective in children 16 years of age and under. CHANTIX should not be used in children 16 years of age and under. It is not known if CHANTIX is safe and effective when used with other stop smoking medicines.</p>	<p>ABOUT THIS MEDICATION</p> <p>What the medication is used for: APO-VARENICLINE is a prescription medicine which is used in combination with supportive counselling to help motivated adults stop smoking.</p> <p>What it does: APO-VARENICLINE can help to relieve the craving and withdrawal symptoms associated with stopping smoking. APO-VARENICLINE does not contain nicotine, but it has been shown to affect the nicotine receptor in the brain that is thought to be most related to smoking addiction. APO-VARENICLINE can affect this receptor in two opposite ways: it acts like a weaker version of nicotine, and also blocks nicotine from getting to the receptor because it binds more tightly. Although it is thought that this may be, in part, how APO-VARENICLINE works, it is not known exactly how the drug works in people.</p>						
	<p>Who should not take CHANTIX?</p> <p>Do not take CHANTIX if you have had a serious allergic or skin reaction to CHANTIX. Symptoms may include:</p> <table border="1" data-bbox="323 1192 1052 1271"> <tr> <td>• swelling of the face, mouth (tongue, lips, gums), throat or neck</td> <td>• rash, with peeling skin</td> <td>• blisters in your mouth</td> </tr> <tr> <td>• trouble breathing</td> <td></td> <td></td> </tr> </table>	• swelling of the face, mouth (tongue, lips, gums), throat or neck	• rash, with peeling skin	• blisters in your mouth	• trouble breathing			<p>When it should not be used:</p> <p>Do not take APO-VARENICLINE if you:</p> <ul style="list-style-type: none"> - are allergic (hypersensitive) to varenicline tartrate or any of the other ingredients of APO-VARENICLINE (see list below of non-medicinal ingredients). - are using nicotine replacement therapy, such as patches, gum or inhaler. The combination of APO-VARENICLINE and nicotine replacement therapy is not expected to improve your chances of quitting, and may result in more side effects than with APO-VARENICLINE alone.
• swelling of the face, mouth (tongue, lips, gums), throat or neck	• rash, with peeling skin	• blisters in your mouth						
• trouble breathing								
	<p>What should I tell my healthcare provider before taking CHANTIX?</p> <p>See “What is the most important information I should know about CHANTIX?” Before you take CHANTIX, tell your healthcare provider if you:</p> <ul style="list-style-type: none"> • use other treatments to quit smoking. Using CHANTIX with a nicotine patch may cause nausea, vomiting, headache, dizziness, upset stomach, and tiredness to happen more often than if you just use a nicotine patch alone. 	<p>BEFORE you use APO-VARENICLINE talk to your healthcare provider if you:</p> <ul style="list-style-type: none"> - have experienced depression or any other mental health problems. Your healthcare provider will monitor you for new or worsened emotional or behavioral problems during treatment with APO-VARENICLINE. - have any problems with your kidneys, as you may need a lower dose of APO- 						

Side-by-Side Comparison Table

	<ul style="list-style-type: none"> • have kidney problems or get kidney dialysis. Your healthcare provider may prescribe a lower dose of CHANTIX for you. • have a history of seizures • drink alcohol • have heart or blood vessel problems • have any other medical conditions • are pregnant or plan to become pregnant. • are breastfeeding. It is not known if CHANTIX passes into breast milk. If you breastfeed and take CHANTIX, monitor your baby for seizures as well as spitting up or vomiting more than normal. <p>Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins and herbal supplements. Your healthcare provider may need to change the dose of some of your medicines when you stop smoking.</p> <p>You should not use CHANTIX while using other medicines to quit smoking. Tell your healthcare provider if you use other treatments to quit smoking.</p> <p>Know the medicines you take. Keep a list of them with you to show your healthcare provider and pharmacist when you get a new medicine.</p>	<p>VARENICLINE.</p> <ul style="list-style-type: none"> - have heart or blood vessel (cardiovascular) problems. - have a history of seizures. - have any other medical conditions. - are pregnant, are breastfeeding or plan to become pregnant (see “Pregnancy” and “Breastfeeding” below). - have diabetes. APO-VARENICLINE can potentially affect your blood sugar regulation, and you may need to monitor your blood sugar more often. If you notice changes, discuss this with your healthcare provider. 						
	<p>How should I take CHANTIX?</p> <ul style="list-style-type: none"> • There are 3 ways that you can use CHANTIX to help you quit smoking. Talk to your healthcare provider about the following 3 ways to use CHANTIX: <ul style="list-style-type: none"> Choose a quit date when you will stop smoking. Start taking CHANTIX 1 week (7 days) before your quit date. Take CHANTIX for 12 weeks. OR Start taking CHANTIX before you choose a quit date. Pick a date to quit smoking that is between days 8 and 35 of treatment. Take CHANTIX for 12 weeks. OR If you are sure that you are not able or willing to quit smoking right away, start taking CHANTIX and reduce smoking during the first 12 weeks of treatment, as follows: <table border="1" data-bbox="323 1045 1129 1377"> <tr> <td data-bbox="323 1045 407 1159">Weeks 1 through 4</td> <td data-bbox="407 1045 1129 1159">Reduce your smoking to reach one-half of your starting daily number of cigarettes. Example: If you usually smoke 20 cigarettes each day, reduce your smoking to 10 cigarettes each day during weeks 1 through 4.</td> </tr> <tr> <td data-bbox="323 1159 407 1273">Weeks 5 through 8</td> <td data-bbox="407 1159 1129 1273">Reduce your smoking to reach one-quarter of your starting daily number of cigarettes. Example: If you usually smoked 20 cigarettes each day, reduce your smoking to 5 cigarettes each day during weeks 5 through 8.</td> </tr> <tr> <td data-bbox="323 1273 407 1377">Weeks 9 through 12</td> <td data-bbox="407 1273 1129 1377">Keep reducing your smoking until you are no longer smoking (you reach zero cigarettes each day).</td> </tr> </table> <p>Aim to quit by the end of the 12th week of treatment, or sooner if you feel ready.</p>	Weeks 1 through 4	Reduce your smoking to reach one-half of your starting daily number of cigarettes. Example: If you usually smoke 20 cigarettes each day, reduce your smoking to 10 cigarettes each day during weeks 1 through 4.	Weeks 5 through 8	Reduce your smoking to reach one-quarter of your starting daily number of cigarettes. Example: If you usually smoked 20 cigarettes each day, reduce your smoking to 5 cigarettes each day during weeks 5 through 8.	Weeks 9 through 12	Keep reducing your smoking until you are no longer smoking (you reach zero cigarettes each day).	<p>PROPER USE OF THIS MEDICATION</p> <p>You are more likely to stop smoking if you are motivated to stop. Your healthcare provider can provide advice, support and sources of further information to help ensure your attempt to stop smoking is successful.</p> <p>To increase the chances of success, APO-VARENICLINE should be used in combination with supportive counselling as recommended by your healthcare provider. Varenicline was used in combination with supportive counselling in the clinical trials. At any time, you can also call government-funded toll-free provincial Quit Lines, to speak to a knowledgeable and supportive specialist; these phone numbers are available on the Health Canada website.</p> <p>Always take APO-VARENICLINE exactly as your healthcare provider has told you. You should check with your healthcare provider if you are not sure.</p> <p>REMEMBER: This medication has been prescribed specifically for you. Do not give it to anyone else.</p> <p>Setting Your Quit Date: Starting treatment before your quit date lets APO-VARENICLINE build up in your body. You can keep smoking until your quit date.</p> <p>There are three ways to set your quit date when using APO-VARENICLINE. Talk to your healthcare provider about which way is best for you:</p> <ul style="list-style-type: none"> • Fixed quit approach: Set a quit date when you will stop smoking. Start taking APO-VARENICLINE 8 to 14 days (1 to 2 weeks) before your quit date. You should take APO-VARENICLINE for 12 weeks. After 12 weeks of treatment, your healthcare provider may recommend an additional 12 weeks of treatment. <p>Or</p> <ul style="list-style-type: none"> • Flexible quit approach: Start taking APO-VARENICLINE, then quit smoking between Day 8 and Day 35 after the start of your treatment (i.e. between Weeks 2 and 5). You should take APO-VARENICLINE for 12 weeks. After 12 weeks of treatment, your healthcare provider may recommend an additional 12 weeks of treatment.
Weeks 1 through 4	Reduce your smoking to reach one-half of your starting daily number of cigarettes. Example: If you usually smoke 20 cigarettes each day, reduce your smoking to 10 cigarettes each day during weeks 1 through 4.							
Weeks 5 through 8	Reduce your smoking to reach one-quarter of your starting daily number of cigarettes. Example: If you usually smoked 20 cigarettes each day, reduce your smoking to 5 cigarettes each day during weeks 5 through 8.							
Weeks 9 through 12	Keep reducing your smoking until you are no longer smoking (you reach zero cigarettes each day).							

Side-by-Side Comparison Table

<p>Continue to take CHANTIX for another 12 weeks, for a total of 24 weeks of treatment.</p> <p>Starting CHANTIX before your quit date gives CHANTIX time to build up in your body. You can keep smoking during this time. Take CHANTIX exactly as prescribed by your healthcare provider.</p> <ul style="list-style-type: none"> • CHANTIX comes as a white tablet (0.5 mg) and a blue tablet (1 mg). You start with the white tablet and then usually go to the blue tablet. See the chart below for dosing instructions for adults. <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Day 1 to Day 3</td> <td style="padding: 2px;">o <u>White</u> tablet (0.5 mg) o Take 1 tablet each day</td> </tr> <tr> <td style="padding: 2px;">Day 4 to Day 7</td> <td style="padding: 2px;">o <u>White</u> tablet (0.5 mg) o Take 1 in the morning and 1 in the evening</td> </tr> <tr> <td style="padding: 2px;">Day 8 to end of treatment</td> <td style="padding: 2px;">o <u>Blue</u> tablet (1 mg) o Take 1 in the morning and 1 in the evening</td> </tr> </table> <ul style="list-style-type: none"> • Make sure that you try to stop smoking on your quit date. If you slip-up and smoke, try again. Some people need to take CHANTIX for a few weeks for CHANTIX to work best. • Most people will take CHANTIX for up to 12 weeks. If you have completely quit smoking by 12 weeks, your healthcare provider may prescribe CHANTIX for another 12 weeks to help you stay cigarette-free. • Take CHANTIX after eating and with a full glass (8 ounces) of water. • This dosing schedule may not be right for everyone. Talk to your healthcare provider if you are having side effects such as nausea, strange dreams, or sleep problems. Your healthcare provider may want to reduce your dose. • If you miss a dose of CHANTIX, take it as soon as you remember. If it is almost time for your next dose, skip the missed dose. Just take your next dose at your regular time. 	Day 1 to Day 3	o <u>White</u> tablet (0.5 mg) o Take 1 tablet each day	Day 4 to Day 7	o <u>White</u> tablet (0.5 mg) o Take 1 in the morning and 1 in the evening	Day 8 to end of treatment	o <u>Blue</u> tablet (1 mg) o Take 1 in the morning and 1 in the evening	<p>Or</p> <ul style="list-style-type: none"> • Gradual quit approach: Start taking APO-VARENICLINE and reduce smoking with a goal to quit smoking by end of 12 weeks of treatment. For example, reduce smoking by half by the 4th week, another half by the 8th week (down to 25%) and then quit by the end of the 12th week. You may quit any time before the end of 12 weeks of treatment, if you are able to. Continue treatment for an additional 12 weeks for a total of 24 weeks. <p>Write down, and keep in a visible or convenient place (for example on the fridge or on the APO-VARENICLINE pack), the date that you started APO- VARENICLINE, your quit date, and the date to stop taking APO-VARENICLINE.</p> <p>Make sure that you try to stop smoking on your quit date. If you slip-up and smoke after that target date, keep trying. Some people need a few weeks on APO-VARENICLINE for it to work best.</p> <p>Dosing Options: APO-VARENICLINE should be taken after eating and with a full glass of water. Regardless of which dose is prescribed, the first week on APO-VARENICLINE is the same, and is described in the following table:</p> <p>Week 1 Dosing Schedule:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="padding: 2px;">Day</th> <th style="padding: 2px;">Dose</th> </tr> </thead> <tbody> <tr> <td style="padding: 2px;">Day 1 to 3</td> <td style="padding: 2px;">Take one white APO-VARENICLINE 0.5 mg tablet once a day.</td> </tr> <tr> <td style="padding: 2px;">Day 4 to 7</td> <td style="padding: 2px;">Take one white APO-VARENICLINE 0.5 mg tablet twice a day, once in the morning and once in the evening, at about the same time each day.</td> </tr> </tbody> </table> <p>After the first week, your healthcare provider may recommend to stay at 0.5 mg twice a day (OPTION 1) or go up to 1 mg twice a day (OPTION 2).</p> <p>Week 2 (day 8) to the end of treatment</p> <p>OPTION 1: Continue on 0.5 mg twice a day</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="padding: 2px;">Day</th> <th style="padding: 2px;">Dose</th> </tr> </thead> <tbody> <tr> <td style="padding: 2px;">Day 8 - end of treatment</td> <td style="padding: 2px;">0.5 mg twice a day: Continue to take one white APO-VARENICLINE 0.5 mg pill in the morning, and one in the evening, at about the same time each day</td> </tr> </tbody> </table> <p>Or</p> <p>OPTION 2: Start taking 1 mg twice a day</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="padding: 2px;">Day</th> <th style="padding: 2px;">Dose</th> </tr> </thead> <tbody> <tr> <td style="padding: 2px;">Day 8 - end of treatment</td> <td style="padding: 2px;">1 mg twice a day: Take one light blue APO-VARENICLINE 1 mg pill in the morning, and one in the evening, at about the same time each day.</td> </tr> </tbody> </table> <p>The maximum dose of APO-VARENICLINE is 1 mg twice a day. Based on the limited data available, the two doses do not appear different in terms of either quit rates, or rates of serious mental health side effects (your healthcare provider can provide more information). Discussion with your healthcare provider is important in order to choose the dose that is best for you. If needed, the dose can be changed depending on how well you tolerate APO-</p>	Day	Dose	Day 1 to 3	Take one white APO-VARENICLINE 0.5 mg tablet once a day. 		<p>VARENICLINE and how effective your healthcare provider and you consider it is in helping you quit smoking. Your healthcare provider will help decide what dose is right for you.</p> <p>Your healthcare provider may recommend to gradually lower the dose at the end of the treatment period rather than stopping abruptly.</p>		
	<p>What should I avoid while taking CHANTIX?</p> <ul style="list-style-type: none"> Use caution when driving or operating machinery until you know how CHANTIX affects you. CHANTIX may make you feel sleepy, dizzy, or have trouble concentrating, making it hard to drive or perform other activities safely. Decrease the amount of alcoholic beverages that you drink during treatment with CHANTIX until you know if CHANTIX affects your ability to tolerate alcohol. Some people have experienced the following when drinking alcohol during treatment with CHANTIX: <table border="1" data-bbox="323 558 1026 613"> <tr> <td>Increased drunkenness (intoxication)</td> <td> <ul style="list-style-type: none"> unusual or sometimes aggressive behavior no memory of things that have happened </td> </tr> </table>	Increased drunkenness (intoxication)	<ul style="list-style-type: none"> unusual or sometimes aggressive behavior no memory of things that have happened 	<p>Can I smoke while taking APO-VARENICLINE? You can keep smoking prior to your quit date. Smoking after your quit date will reduce your chance of breaking your smoking addiction. Some people have reported a change in the taste of cigarettes after starting APO-VARENICLINE.</p> <p>Drinking alcohol during treatment with APO-VARENICLINE may increase the risk of mental health symptoms. Reported experiences include:</p> <ul style="list-style-type: none"> unusual or sometimes aggressive behavior; more intoxicated than expected from the amount of alcohol; no memory of things that have happened. <p>Use of APO-VARENICLINE with other therapies for smoking-cessation: The safety and benefits of taking APO-VARENICLINE in combination with other medicines for stopping smoking have not been studied. Taking APO-VARENICLINE in combination with other smoking-cessation therapies (e.g., nicotine replacement therapy) is therefore not recommended. Using APO-VARENICLINE in combination with nicotine replacement therapies (e.g., patch gum or inhaler) is not likely to increase your chances of quitting smoking, and it may result in more side effects than with APO-VARENICLINE alone.</p>
Increased drunkenness (intoxication)	<ul style="list-style-type: none"> unusual or sometimes aggressive behavior no memory of things that have happened 			
	<p>What are the possible side effects of CHANTIX?</p> <p>Serious side effects of CHANTIX may include:</p> <ul style="list-style-type: none"> See “What is the most important information I should know about CHANTIX?” Seizures. Some people have had seizures during treatment with CHANTIX. In most cases, the seizures have happened during the first month of treatment with CHANTIX. If you have a seizure during treatment with CHANTIX, stop taking CHANTIX and contact your healthcare provider right away. New or worse heart or blood vessel (cardiovascular) problems, mostly in people, who already have cardiovascular problems. Tell your healthcare provider if you have any changes in symptoms during treatment with CHANTIX. Get emergency medical help right away if you have any of the following symptoms of a heart attack, including: chest discomfort (uncomfortable pressure, squeezing, fullness or pain) that lasts more than a few minutes, or that goes away and comes back pain or discomfort in one or both arms, back, neck, jaw or stomach shortness of breath, sweating, nausea, vomiting, or feeling lightheaded associated with chest discomfort Sleepwalking can happen with CHANTIX, and can sometimes lead to behavior that is harmful to you or other people, or to property. Stop taking CHANTIX and tell your healthcare provider if you start sleepwalking. Allergic reactions can happen with CHANTIX. Some of these allergic reactions can be life-threatening. 	<p>The effects of changes in your body resulting from stopping smoking, with or without treatment with APO-VARENICLINE, may alter the way other drugs work. Tell your healthcare provider about all your other medicines, including prescription and nonprescription medicines, vitamins and herbal supplements. Especially, tell your healthcare provider if you take:</p> <ul style="list-style-type: none"> Insulin Asthma medicines (theophylline) Blood thinner (warfarin) <p>as an adjustment of the dose of these medicines may be necessary once you are smoke-free.</p> <p>Mental Health Symptoms See “What is the most important information I should know about APO-VARENICLINE?”</p> <p>Pregnancy Talk to your healthcare provider if you are pregnant or planning to become pregnant. You should not take APO-VARENICLINE while you are pregnant. It is unknown if APO-VARENICLINE will harm your unborn baby. It is best to stop smoking before you get pregnant.</p> <p>Breastfeeding You should ask your healthcare provider for advice before taking any medication, including APO-VARENICLINE, if you are breastfeeding, as the medicine may pass into breast milk. APO-VARENICLINE is not recommended for use in children under 18 years of age.</p>
